***EXECUTIVE SUMMARY***

The 2016 and 2022 Air Quality Management Plans (AQMP) included a suite of facility-based mobile source measures to collectively reduce emissions of nitrogen oxides (NO<sub>x</sub>) from the goods movement sector, to assist in meeting state and federal air quality standards for ozone and fine particulate matter. NO<sub>x</sub> is the key pollutant that must be controlled in order to meet federal air quality standards, and over 80 percent of the NO<sub>x</sub> in our area is from mobile sources. In May 2018, the South Coast Air Quality Management District (South Coast AQMD) Governing Board directed staff to initiate rulemaking to address one of the 2016 AQMP facility-based mobile source measures, namely Control Measure MOB-02: Emission Reductions at Rail Yards and Intermodal Facilities. Consistent with that direction and the subsequent adoption of similar facility-based measures in the 2022 AQMP, staff proceeded with rulemaking for Proposed Rule 2306 and PR 316.2 to address emissions from both new and existing freight rail yards. In the meantime, additional rules to implement other facility-based measures have been adopted or initiated, including Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program, which was adopted in 2021 and has been implemented ever since, and Proposed Rule 2304 – Commercial Marine Ports – Container Terminals. All three rulemakings are designed to be part of an overall effort to facilitate and further emission reductions from key freight transportation hubs and are supplemented by concurrent incentive programs and other non-regulatory measures.

PR 2306 establishes emission reductions and zero emission infrastructure reporting requirements for owners and operators of new and existing freight rail yards. These emission reductions will help to attain both California and National Ambient Air Quality Standards (CAAQS and NAAQS, respectively), as well as air quality priorities outlined in the corresponding AB 617 Community Emissions Reduction Plans (CERPs). When implemented, PR 2306 will provide additional health benefits to the local communities surrounding new and existing freight rail yards that operate within the South Coast AQMD jurisdiction. PR 316.2 establishes fees to be paid by freight rail yard owners or operators subject to PR 2306 to recover the South Coast AQMD's reasonable regulatory costs associated with PR 2306 implementation and compliance, such as costs associated with review of reports and notifications and the associated auditing, inspection, and enforcement activities.

Specifically, PR 2306 seeks to reduce NO<sub>x</sub> emissions associated with freight rail yard operations by requiring operators of freight rail yards to meet or exceed emission reductions targets. The proposed rule will ensure that emission reductions at each freight rail yard within the South Coast AQMD jurisdiction will be achieved at levels that are proportional or more-than-proportional to reductions throughout California from implementation of recently adopted statewide regulations affecting freight rail yard emission sources. Additional emission reductions may be achieved in South Coast AQMD if implementation of statewide regulations alone does not result in compliance with PR 2306. Additionally, any state or local government agency contracting with the owner or operator of a freight rail yard in relation to its lease, construction, or operation will be required to include requirements for rule compliance in the new, renewed, or amended contract.

PR 2306 and PR 316.2 were developed through a public process including 13 Working Group Meetings and several Community Meetings. The Working Group is composed of affected facilities, environmental and community representatives, public agencies, consultants, equipment vendors, and other interested parties.

# **CHAPTER 1 : BACKGROUND**

**INTRODUCTION**

**RULEMAKING BACKGROUND**

**PUBLIC PROCESS**

**LEGAL AUTHORITY**

## ***INTRODUCTION***

Proposed Rule 2306 – Freight Rail Yard Rule (PR 2306) and Proposed Rule 316.2 – Fees for Rule 2306 (PR 316.2) are part of the suite of Facility Based Mobile Source Measures (FBMSMs) aimed at collectively addressing emissions related to the goods movement. NO<sub>x</sub> is the key pollutant that must be controlled to meet both ozone and fine particulate matter (PM<sub>2.5</sub>) standards in our region. Over 80 percent of the NO<sub>x</sub> emissions in the South Coast Air Basin (Basin) are from mobile sources, and nearly half of these come from mobile sources associated with goods movement.<sup>1</sup> South Coast AQMD continues to address emissions associated with the goods movement sector through the development of PR 2306, as well as the adopted Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and Proposed Rule 2304 – Commercial Marine Ports - Container Terminals, which are indirect source rules designed to be part of an overall effort to facilitate and further emission reductions from key mobile sources associated with warehouses and ports, respectively.

Environmental Justice (EJ) communities in the South Coast AQMD region are disproportionately impacted by various types of pollution and experience health, social, and economic inequities. These communities are often located near multiple air pollution sources including mobile sources and commercial and industrial facilities, such as freight rail yards. Communities adjacent to freight rail yards are exposed to higher levels of emissions from the associated mobile sources and activities. These emissions not only contain NO<sub>x</sub>, but also PM<sub>2.5</sub>. Short-term exposure to PM<sub>2.5</sub> is well known to worsen pre-existing heart and lung conditions, while long term exposure can be linked to premature mortality especially among those with chronic heart or lung disease. Like PM<sub>2.5</sub>, ozone is known to cause airway and lung irritation, and is associated with increased asthma cases, as well as decreased lung capacity, especially among children and the elderly. Exposure to air toxics emitted from heavy-duty diesel engines used in freight transportation further worsens the health risk for residents in the EJ communities.

PR 2306 and PR 316.2 are applicable to owners and operators of freight rail yards located in the South Coast AQMD jurisdiction. Freight rail yards are rail yards where switching activities occur or where cargos, either in containers or not, are loaded onto or unloaded from railcars for transportation to or from a rail yard. Emissions associated with freight rail yards are emitted from locomotives, drayage trucks, cargo handling equipment (CHE), and miscellaneous off-road equipment like transportation refrigeration units (TRUs).

PR 2306 requires operators of freight rail yards to reduce NO<sub>x</sub> emissions associated with freight rail yard operations by meeting or exceeding specific emission reductions targets. The proposed targets will ensure that emission reductions at each freight rail yard within the South Coast AQMD jurisdiction will be achieved at levels that are proportional or more-than-proportional to implementation of recently adopted statewide regulations throughout California. The key statewide regulations relative to PR 2306 addressing freight rail yard emission sources are California Air Resources Board's (CARB) In-Use Locomotive and Advanced Clean Fleets (ACF) regulations, both adopted in 2023. Emission reductions targets are expected to be achieved through reductions from one or more freight rail yard emission sources, including locomotives and drayage trucks subject to these two CARB regulations, as well as from all other mobile sources associated

<sup>1</sup> Southern California Association of Governments. Transportation System Goods Movement: [https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocial\\_goods-movement.pdf?1606001690](https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocial_goods-movement.pdf?1606001690)

with freight rail yards to transport or assist in transporting cargo or goods. Additional emission reductions may be achieved in South Coast AQMD if implementation of statewide regulations alone does not result in compliance with PR 2306. Owners and operators of freight yards would also pay fees as established by PR 316.2 to reimburse South Coast AQMD for reasonable administrative costs associated with implementation of PR 2306.

### ***RULEMAKING BACKGROUND***

In 2006, South Coast AQMD adopted Regulation XXXV – Railroad and Railroad Operations to address emissions from rail yards and locomotives, seeking to control emissions generated from locomotive idling and requiring operators of rail yards to develop emissions inventories and conduct health risk assessments. This regulation was enjoined by a federal district court and that decision was upheld on appeal. As a result of this litigation, Regulation XXXV cannot be implemented.

The South Coast AQMD develops Air Quality Management Plans (AQMPs) to show how the region will attain ambient air quality standards. In the 2016 AQMP, the South Coast AQMD committed to assist the California Air Resources Board (CARB) and U.S. Environmental Protection Agency (U.S. EPA) in developing the “Further Deployment of Cleaner Technologies” control measures (Further Deployment Measures), based on a combination of incentive funding and development of new regulations. These measures are aimed at achieving the substantial NOx emission reductions needed to meet ozone and PM2.5 standards in our region. This process initiated the development of local FBMSMs. Control measure MOB-02: Emission Reductions at Rail Yards and Intermodal Facilities, is one of these FBMSMs.

The 2016 AQMP described a year-long process for staff to evaluate potential emissions reduction strategies for the FBMSMs and report back to the Governing Board on the most promising approach. South Coast AQMD staff convened a working group to explore potential voluntary and regulatory approaches for both new and existing rail yards consistent with what was outlined in the 2016 AQMP for control measure MOB-02. After considering the results of that year-long process, in May 2018, the South Coast AQMD Governing Board directed staff to initiate rulemaking for new and existing rail yards.

The 2022 AQMP reflects a continued effort on implementation of Further Deployment Measures for control measure MOB-02 as well as CARB’s 2022 State Strategy for the State Implementation Plan (2022 SIP Strategy). After staff explored both regulatory and voluntary approaches, rulemaking for PR 2306 was reinitiated to include both new and existing freight rail yards.

### **Air Quality Management Plan**

South Coast AQMD is the regional air quality regulatory agency for all of Orange County, and large portions of Los Angeles, Riverside, and San Bernardino counties. It is responsible for developing and enforcing air pollution control rules and regulations and implementing strategies to attain ambient air quality standards for the Basin and the Riverside County portions of both the Salton Sea Air Basin (SSAB) and the Mojave Desert Air Basin (MDAB). The federal Clean Air Act (CAA) requires the submission of State Implementation Plans (SIP) for nonattainment areas that do not meet the federal NAAQS. Additionally, the California Clean Air Act (CCAA) imposes further requirements on meeting state ambient air quality standards for criteria pollutants. The South Coast AQMD’s ozone levels are the highest in the nation, and the region is currently classified as being in extreme nonattainment status for the federal NAAQS ozone standards.

Per the Health and Safety Code, South Coast AQMD is required to adopt plans to demonstrate how the region will meet both federal and state ambient air quality standards for South Coast AQMD’s jurisdiction.<sup>7</sup> The AQMP is a blueprint for meeting federal and state air quality standards in South Coast AQMD’s jurisdiction. On December 2, 2022, South Coast AQMD’s Governing Board adopted the 2022 AQMP.<sup>8</sup> Based on analysis in the 2022 AQMP the total NOx emissions in the Basin must be further reduced by approximately 124 tons per day (tpd) beyond reductions from in-place regulations in 2037 - an additional 67 percent reduction in NOx beyond baseline 2037 levels in order to meet the 2015 8-hour ozone standard by the 2037 deadline. Based on the information in Figure 1-1, approximately 80 percent of NOx emissions in 2037 will be from mobile sources.

**Figure 1-1. Baseline NOx Emissions and Reductions Needed to Achieve Federal 8-Hour Ozone NAAQS in the Basin**

The control strategy in the 2022 AQMP includes many stationary and mobile source measures that will be carried out by the South Coast AQMD and CARB (Figure 1-2). To attain the federal ozone and PM2.5 NAAQS, the 2022 AQMP relies on reducing regional NOx emissions as a primary strategy as NOx is a precursor to the formation of both ozone and PM2.5 but also includes measures to reduce directly emitted PM2.5.

**Figure 1-2. Summary of Approach to Reducing NOx Emissions by Major Source Category**

**Assembly Bill 617 Community Emission Reduction Plans**

The South Coast AQMD Governing Board has approved several other plans since adoption of the 2016 AQMP that would also benefit from adoption of PR 2306. These include Community Emission Reduction Plans (CERPs) prepared pursuant to Assembly Bill (AB) 617. These plans provide a strategic framework to lower air pollution emissions and exposure, targeting the top air quality concerns for each community.

Assembly Bill (AB) 617 is a program established to address the disproportionate burden of air pollution on EJ communities, by providing funding and enabling selected communities to shape the actions to reduce emissions. South Coast AQMD currently has six designated communities where CERPs have been developed to prioritize these actions. Rail yard emissions are an area of concern and an air quality priority in CERPs for the following AB 617 communities: San Bernardino/Muscoy (SBM), Wilmington/Carson/West Long Beach (WCWLB), East Los Angeles/Boyle Heights/West Commerce (ELABHWC), and Southeast Los Angeles (SELA). These AB 617 communities identify specific measures needed to reduce emissions from rail yards.

**AB 617 CERP Actions**

PR 2306 and PR 316.2 address a portion of the actions outlined in the CERPs for SBM, WCWLB, ELABHWC, and SELA. Some of the actions outlined in these CERPs include working with CARB to reduce air pollution at rail yards, replace diesel fueled equipment with cleaner technologies, and development of an indirect source rule for rail yards. The development of PR 2306 and PR 316.2 is an ongoing effort from staff to develop a rule that addresses FBMSMs pertaining to emissions from both new and existing rail yards in the 2022 AQMP, and simultaneously meet the action

items listed in the applicable CERPs. Staff also works with various outside regulatory air quality agencies, such as CARB, to develop the concepts and requirements of agency rules and regulations and continues to work on regulations to further meet the actions in AB 617 CERPs located within South Coast AQMD.

### **Previous South Coast AQMD Efforts**

#### ***Regulation XXXV***

South Coast AQMD has established three rules under Regulation XXXV on railroads and related operations, including Rule 3501 with requirements for recordkeeping of idling events to support quantification of emissions, Rule 3502 mandates minimizing unnecessary locomotive idling, and Rule 3503 with requirements to prepare emissions inventories, health risk assessments, and public notification for railroads and rail yards. However, as previously discussed, these rules cannot be enforced because they have been enjoined by the federal court.

#### ***Railroad MOU***

Another effort made by South Coast AQMD to address rail yard emissions was a potential railroad memorandum of understanding (MOU). The MOU was pursued starting mid-2023 between South Coast AQMD, Union Pacific Railroad, and Burlington Northern Santa Fe Railroad. The proposed agreement between the railroads and South Coast AQMD aimed to reduce air quality impacts from existing and new rail yards by reducing emissions from locomotives applicable to the agreement, yard trucks, and rubber-tired gantry cranes. It also considered elements that included zero emission infrastructure plans and technology demonstrations. The parties did not come to an agreement and staff efforts resumed to rule development in November 2023.

#### ***PUBLIC PROCESS***

PR 2306 and PR 316.2 were developed through a public process that included a series of Working Group meetings. Since the South Coast AQMD Governing Board voted to initiate rulemaking in May 2018, staff began the rule development process and has conducted thirteen Working Group meetings to date. The Working Group is composed of affected facilities, environmental and community representatives, public agencies, consultants, equipment vendors, and interested parties. The purpose of the Working Group meetings was to provide all stakeholders an opportunity to discuss details of the proposed rules, and for staff to listen to stakeholder concerns with the objective of building consensus and resolving any issues. Table 1-1 summarizes the public meetings held throughout the development of PR 2306 and PR 316.2 and provides a summary of the key topics discussed at each of the meetings.

### **LEGAL AUTHORITY**

The South Coast AQMD may adopt PR 2306 through the authority to “adopt and enforce rules and regulations to achieve the state and federal ambient air quality standards in all areas affected by emission sources under [South Coast AQMD’s] jurisdiction.” (Health and Safety Code Section 40001; *see also* section 40702.) Generally, CARB has primary authority over emissions from motor vehicles, and the South Coast AQMD has primary authority over all sources in the Basin, except motor vehicles. (Health and Safety Code Section 40000.) This includes locomotives and other nonroad mobile sources. Health and Safety Code section 40716 also recognizes that air districts may adopt and implement regulations that control emissions from indirect and areawide sources in order to meet state ambient air quality standards. (*See also* Health and Safety Code Section 40440(b)(3) (directing South Coast AQMD to regulate indirect source emissions in areas where there are high-level localized levels of pollutants and new sources which will have a significant impact on air quality).)

The key pollutant of interest for PR 2306 is NO<sub>x</sub> (a key precursor pollutant for ozone and PM<sub>2.5</sub>). The South Coast AQMD is in nonattainment status of the CAAQS for both ozone and PM<sub>2.5</sub>. For both ozone and PM<sub>2.5</sub>, the currently applicable 8-Hour CAAQS and 8-hour NAAQS are set at equivalent levels. As a result, the South Coast AQMD relies on the same measures to meet both federal and state ozone and PM<sub>2.5</sub> standards.

In addition, the Clean Air Act recognizes state’s authority to include “as part of an applicable [state] implementation plan, an indirect source review program which the State chooses to adopt and submit as part of its plan.” (Clean Air Act (CAA) § 110(a)(5)(A)(i); 42 U.S.C. § 7410(a)(5)(A)(i).) An indirect source is defined as “a facility, building, structure, installation, real property, road, or highway which attracts, or may attract, mobile sources of pollution.” (CAA § 110(a)(5)(C); 42 U.S.C. § 7410(a)(5)(C).) Rail yards come within the CAA’s definition of indirect sources. *See Ctr. for Cmty. Action & Env’t Just. v. BNSF R. Co.* (9th Cir. 2014) 764 F.3d 1019. Also, the Clean Air Act acknowledges that states and their subdivisions have the right to “adopt or enforce any standard or limitation respecting emissions of air pollutants” and also “any requirement respecting control or abatement of air pollution” so long as it is not less stringent than a federal requirement. (CAA § 116; 42 U.S.C. § 7416.)

The South Coast AQMD Governing Board approved the 2016 AQMP in March of 2017. The 2016 AQMP was subsequently approved by CARB and included in SIP; the ozone-related portion of the AQMP was approved by U.S. EPA in 2019.<sup>2</sup> The 2016 AQMP included MOB-02, a facility-based mobile source control measure to reduce mobile source emissions associated with rail yards and intermodal facilities. By approving MOB-02 into the 2016 AQMP, South Coast AQMD and CARB have committed to, and U.S. EPA has authorized, the development of an indirect source rule to achieve emission reductions from mobile sources attributable to activities associated with rail yards and intermodal facilities, in order to assist attaining the federal ozone NAAQS in 2023 and 2031. While MOB-02 was adopted as part of the NO<sub>x</sub> emissions reduction strategy for ozone, the 2016 AQMP also recognized that the “NO<sub>x</sub> strategy will assist in meeting the annual PM<sub>2.5</sub> standard as “expeditiously as practicable” before the attainment year of 2025.” (2016 AQMP, pp. 4-52.)

Initially, the South Coast AQMD Governing Board authorized a one-year public process to identify if MOB-02 could be achieved through voluntary or regulatory measures, and then ultimately determined, in May of 2018, that staff should pursue a regulatory approach while also considering potential voluntary measures. Through November 2023 significant resources were expended exploring potential voluntary measures; however, none were agreed upon after extended discussions with stakeholders.

A California Attorney General Opinion (CA AG Opinion) from 1993 determined that a district could adopt a regulation to,

---

<sup>2</sup> The 2016 AQMP demonstrated attainment of the 1979 1-hour ozone NAAQS, the 1997 and 2008 8-hour ozone NAAQS, as well as the 2006 24-hour PM<sub>2.5</sub> NAAQS and the 2012 annual PM<sub>2.5</sub> NAAQS. However, the U.S. EPA did not act on the annual PM<sub>2.5</sub> plan for several years, and recently asked for an updated attainment demonstration that considers newly available near-road monitoring data. As a result, South Coast AQMD withdrew the annual PM<sub>2.5</sub> plan and will submit a revised plan in Spring 2024.

“... require the developer of an indirect source to submit the plans to the district for review and comment prior to the issuance of a permit for construction by a city or county. A district may also require the owner of an indirect source to adopt reasonable post-construction measures to mitigate particular indirect effects of the facility’s operation.”

The opinion acknowledged a district may adopt a regulation requiring new and existing indirect sources to submit plans to the district to mitigate mobile indirect source emissions from both construction and operations that are attributed to the source. However, the scope of the district’s indirect source authority is not limited to the review of plans and the implementation of reasonable post-construction measures. Health and Safety Code section 40716 broadly authorizes the implementation of measures that “reduce or mitigate” emissions from indirect sources. The only state law limitation on such regulation is a prohibition on requiring permits for an indirect source. See 76 Ops. Cal. Atty. Gen. 11 (Mar. 11, 1993). The Clean Air Act does not limit the scope of an indirect source rule adopted by a state, as confirmed by the CA AG Opinion and Health and Safety Code section 40716.

Following the 2016 AQMP, the 2022 AQMP continues to include rail yard-related, facility-based mobile source measures, specifically MOB-02A – Emission Reductions at New Rail Yards and Intermodal Facilities and MOB-02B – Emission Reductions at Existing Rail Yards and Intermodal Facilities, to further outline emission reductions strategies. Through a public process, PR 2306 will seek to reduce emissions associated with freight rail yards and implement MOB-02A and MOB-02B of the 2022 AQMP. PR 2306 will focus on reducing overall emissions from all rail yard-related mobile sources, whether from line haul locomotives, switch locomotives, drayage trucks, transportation refrigeration units, cargo handling equipment, and other on-site support equipment. PR 2306 will also require information to be reported periodically on any installed, ongoing, or planned infrastructure development used to support zero emission technologies for applicable mobile source attracted to freight rail yards.

Implementation of PR 2306 will also meet the requirement for districts in extreme nonattainment to consider all feasible measures that have been implemented in other areas in order to meet state standards. (Health and Safety Code Section 40920.5(c)) While the term “feasible” is not defined in the Health and Safety Code, it is defined in other state laws as “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors.” (Public Resources Code, § 21061.1)

There are several examples of indirect source rules that have already been adopted in California. For example, South Coast AQMD Rule 2305 – Warehouse Indirect Source Rule, which requires operators of warehouses greater than or equal to 100,000 square feet to reduce emissions through a menu of emission-abating or mitigation options, and South Coast AQMD Rule 2202, which requires employers of 250 or more employees to reduce mobile source emissions generated by employee commutes. Rule 2305 was recently upheld against multiple legal challenges. *Cal. Trucking Ass’n v. S. Coast Air Quality Mgt. Dist.* (C.D. Cal. Dec. 14, 2023) No. LACV2106341JAKMRWX, 2023 WL 9622548. In addition, the San Joaquin Valley Unified Air Pollution Control District adopted Rule 9510, which requires new development projects that meet certain specifications to reduce emissions of PM 10 and NOx. As other California air districts have already adopted and implemented indirect source rules, policies, and/or the collection of reduction fees, this type of measure has been shown in a variety of areas to be “feasible.” Of course, feasibility is ultimately a rule-specific consideration. Staff has considered feasibility in drafting

PR 2306 and PR 316.2. Furthermore, the authority for air districts to set emission reductions targets from indirect sources was earlier upheld in state and federal courts. *See Cal. Bldg. Indus. Assoc. v. San Joaquin Air Pollution Control District*, 178 Cal.App.4<sup>th</sup> 120 (2009); *NAHB v. San Joaquin Valley UAPCD*, 627 F.3d 730 (9th Cir. 2010).

Health and Safety Code section 40717 further requires districts to “adopt, implement, and enforce transportation control measures for the attainment of state or federal ambient air quality standards.” The section defines transportation control measures as “any strategy to reduce vehicle trips, vehicle use, vehicle miles traveled, vehicle idling, or traffic congestion for the purpose of reducing motor vehicle emissions.” (Health and Safety Code Section 40717 (g).) PR 2306 will facilitate the reductions of motor vehicle emissions associated with freight rail yards by including emission reductions from drayage trucks servicing the freight rail yards in the multiple options for freight rail yards to comply with the proposed emission reductions targets.

In addition to the above provisions, the South Coast AQMD may adopt rules or regulations that require “the owner or the operator of any air pollution emission source to take such action as the state board or the district may determine to be reasonable for the determination of the amount of such emission from such source.” (Health and Safety Code Section 41511.) Specifically, under Health and Safety Code Section 40701(g), the South Coast AQMD is authorized to collect information regarding a source, “except a noncommercial vehicular source,” including requiring an operator to provide “(1) a description of the source, and (2) disclosure of the data necessary to estimate the emissions of pollutants for which ambient air quality standards have been adopted, or their precursor pollutants.” These sections of the Health and Safety Code therefore authorize the South Coast AQMD to require owners and operators of freight rail yards to provide information that may be used to quantify emissions based on activity associated with the operation of an applicable freight rail yard.

Programs reducing emissions of precursors to ozone and PM<sub>2.5</sub> for purposes of achieving and maintaining the NAAQS or CAAQS may also have concurrent benefits in reducing emissions of air toxics. The district may adopt rules to reduce emissions from sources that may affect public health. One of the duties imposed upon the district is the duty to enforce Health and Safety Code section 41700. That section provides:

“Except as otherwise provided in section 41705, no person shall discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.”

Accordingly, the South Coast AQMD may adopt regulations to prevent the potential health impacts from toxic air contaminants, including diesel PM, as well as to reduce the emissions of criteria air pollutants. The California Supreme Court has upheld the districts’ authority to regulate air toxic emissions from sources within their jurisdiction. (*Western Oil & Gas Assoc. v. Monterey Bay Unified Air Pollution Control Dist.* (1989) 49 Cal.3d 408.)

The South Coast AQMD’s earlier rules limiting rail idling and related measures were enjoined by the federal courts on the ground that they were preempted by the federal Interstate Commerce Commission Termination Act (ICCTA). In brief, the Court of Appeal held that ICCTA preempts

state laws that “may reasonably be said to have the effect of managing or governing rail transportation.” *Ass’n. of Am. R.R.s v. South Coast Air Quality Mgt. Dist.*, 622 F. 3d 1094, 1097 (9th Cir. 2010) (“AAR”). But laws may escape preemption if they are “laws of general applicability that do not unreasonably interfere with interstate commerce.” AAR, p. 1097.

Moreover, once a rule is approved by the U.S. EPA into the state implementation plan, a different test applies. The Ninth Circuit held that “...to the extent that state and local agencies promulgate U.S. EPA-approved statewide plans under federal environmental laws (such as ‘statewide implementation plans’ under the Clean Air Act), ICCTA generally does not preempt those regulations, because it is possible to harmonize ICCTA with those federally-recognized regulations.” AAR, p. 1098. This is because “if an apparent conflict exists between ICCTA and a federal law, then the courts must strive to harmonize the two laws, giving effect to both laws if possible.” AAR, p. 1097.

However, until approved by the U.S. EPA into the state implementation plan, District rules “do not have the force and effect of federal law, even if they might in the future.” AAR, p. 1098. Therefore, the rules in that case were not entitled to harmonization. In contrast, PR 2306 provides that it becomes effective only upon approval by the U.S. EPA into the state implementation plan and after it also grants the requested authorization and/or waiver for CARB’s ACF Regulation and authorization for CARB’s In-Use Locomotive Regulation. Therefore, PR 2306 will have the force and effect of federal law if adopted and approved into the state implementation plan, and must be harmonized with ICCTA, and generally will not be preempted. AAR, p. 1098.

PR 316.2 establishes fees for filing specified reports as required by PR 2306. South Coast AQMD staff will need to audit the reports filed and perform investigations and inspections as needed to verify the accuracy and completeness of these reports. Also, as required, staff will need to engage in enforcement actions to ensure compliance with the provisions of Proposed Rule 2306. The fees set in PR 316.2 are based on staff estimates of the time needed for various staff members to administer and enforce PR 2306. These estimates provide the expected number of hours for each job classification multiplied by the burdened hourly rate for each position. The burdened hourly rate includes salary and benefits for that position, plus a proportionate share (based on an allocation per FTE) of district operational expenses such as costs for the building, utilities, insurance, etc. Similarly, PR 316.2 also establishes fees for specified notifications to be submitted occasionally as required by PR 2306. These fees reflect the time and effort by the South Coast AQMD staff to administratively process the notifications, update internal records of any notified changes to the freight rail yards subject to PR 2306 for enforcement purposes, and to conduct any necessary inspections.

The state Health and Safety Code provides for the recovery of costs of regulation from indirect sources, such as the freight rail yards in this case. State law does not include a definition of “indirect source” but there is a definition in federal law as a “facility, building, structure, installation, real property, road, or highway which attracts, or may attract, mobile sources of pollution.” Clean Air Act Section 110(a)(5)(C). Freight rail yards are facilities that attract several types of mobile sources and thus are “indirect sources.” State law provides that “the south coast district may adopt, by regulation, a schedule of fees to be assessed on areawide or indirect sources of emissions which are regulated, but for which permits are not issued, by the south coast district to recover the costs of district programs related to those sources.” Health & Safety Code Section 40522.5.

District regulatory fees such as these are exempt from the requirements of Proposition 26 (2010) which generally classifies most charges by local governments as “taxes”, which are subject to specific requirements for adoption by popular vote. Exception 3 provides for local government fees “for the reasonable regulatory costs to a local government for issuing licenses and permits, performing investigations, inspections, and audits, enforcing agricultural marketing orders, and the administrative enforcement and adjudication thereof.” These fees will be used for investigations, inspections, auditing, and enforcement and are therefore exempt from Proposition 26.

## **CHAPTER 2 : FREIGHT RAIL YARD EMISSIONS AND AIR QUALITY NEEDS**

**INTRODUCTION**

**FREIGHT RAIL YARD EMISSION SOURCES AND EMISSION  
REDUCTIONS STRATEGIES**

**CURRENT STATE REGULATIONS ADDRESSING FREIGHT RAIL  
YARD EMISSION SOURCES**

**ZERO EMISSION INFRASTRUCTURE NEEDS**

**PUBLIC HEALTH AND AIR QUALITY NEEDS**

**BASELINE EMISSIONS INVENTORY OF FREIGHT RAIL YARD**

**INTRODUCTION**

PR 2306 will reduce emissions from the goods movement sector by requiring freight rail yard operators to take actions that will achieve emission reductions from associated operations. PR 2306 would require freight rail yards to seek pathways to reduce emissions from associated sources, including locomotives, drayage trucks, CHE, and sources such as TRUs. One method to achieve such emission reductions might be to turn over lower tier engines with higher exhaust emissions to the cleanest available technologies within South Coast AQMD consistent with turnover that is expected statewide from CARB regulations. Other compliance methods could be used in accordance with the methods allowed by CARB regulations including the In-Use Locomotive Regulation and the ACF Regulation. No single regulation or rule could achieve federal air quality standards on its own, including PR 2306. This proposed rule is designed to enhance emission reductions from other programs in the South Coast AQMD jurisdiction and is part of the collection of actions needed to meet air quality standards.

**FREIGHT RAIL YARD EMISSION SOURCES AND EMISSION REDUCTIONS STRATEGIES**

The on-road and off-road mobile emission sources at freight rail yards covered under PR 2306 include: 1) locomotives powering inbound and outbound trains, 2) heavy-duty trucks delivering or picking up cargo (full or empty containers) to and from rail yards, 3) transport refrigeration units (TRU) on containers, trailers, railcars, and trucks, 4) cargo handling equipment (CHE) used for moving and handling cargo within the rail yard, and 5) other on-site support equipment (OSE). These sources account for the majority of emissions from freight rail yards.

Emission standards for diesel-powered off-road engines are set by U.S. EPA using a tier-based ranking system on exhaust emissions ranging from Tier 0 to Tier 4.<sup>3</sup> Currently, Tier 4 engines are ranked as the cleanest available technology for off-road engines, and have generally been available since 2015.<sup>4</sup> For some applications, zero emissions off-road vehicles are also becoming commercially available, and their availability is anticipated to increase through time. For on-road engines, CARB has set the cleanest engine standard in its Low NOx Omnibus regulation and has also established zero emission standards in its Advanced Clean Trucks Regulation and introduced requirements of zero emission fleets in the subsequent ACF Regulation.<sup>5</sup>

Emission reductions strategies across mobile sources tend to be consistent, although the plausible implementation of these strategies differ across categories. The emission reductions strategies include turnover to a cleaner fleet and the minimization of idling emissions. Minimization of idling emissions typically occurs in one of two ways, either through an operational change that would lower the time a mobile source would need to spend idling, or Zero Emissions Auxiliary Engine technology through which a source can idle without emissions.

Emission reductions can also potentially be achieved from mobile sources through a shift from one type of mobile source to another. For example, shifting passenger travel from single occupancy

---

<sup>3</sup> U.S. EPA. Emission Standards Reference Guide for On-road and Nonroad Vehicles and Engines: <https://www.epa.gov/emission-standards-reference-guide>

<sup>4</sup> CARB is also developing a new engine standard, Tier 5, for off-road engines. If adopted by CARB, this regulation would require authorization from EPA: <https://ww2.arb.ca.gov/our-work/programs/tier5>

<sup>5</sup> CARB. Heavy Duty Low NOx Omnibus: <https://ww2.arb.ca.gov/our-work/programs/heavy-duty-low-nox>, CARB. Advanced Clean Trucks Regulation: <https://ww2.arb.ca.gov/rulemaking/2019/advancedcleantrucks>

cars with internal combustion engines to zero emission light rail transit can reduce emissions. However, not all mode shifts necessarily reduce emissions. For example, CARB has shown that current truck regulations in California will reduce NO<sub>x</sub> and PM<sub>2.5</sub> emissions so much that transporting goods will be less polluting using trucks than trains.<sup>6</sup> This result could change depending on how quickly trucks or locomotives are turned over to clean technologies.

### A. Locomotives

Inbound and outbound trains servicing freight rail yards are powered by several diesel “line haul” locomotives for long-haul or regional transport of cargo to and from freight rail yards. Typically, an inbound or outbound freight train is powered by three or four line haul locomotives, each rated to an average of 4,000 horsepower (hp). Line haul locomotives are also sometimes used at rail yards for on-site movements of railcars in breaking down arriving trains and assembling departing trains.

Switch locomotives are locomotives that generally operate within the freight rail yard boundary and are used for assembling and dis-assembling trains, maintenance, removing empty cars, and other operational needs. These locomotives are powered by smaller diesel engines, each rated to an average of 2,000 hp. Switch locomotives are also available as “Genset” (short for generator sets) locomotives in which typically two or three off-road diesel engines are connected in series to power the switch locomotive.

In diesel-powered locomotives, the engine’s output power generated from diesel fuel combustion is converted to electrical energy in an alternator or generator which is then transmitted to electric motors directly connected to the locomotive drive wheels for propulsion. Locomotives operate at discrete power settings or notches which include eight power notches (ranged at settings 1 to 8), corresponding to different speeds, as well as idle and dynamic brake notch settings.

New and remanufactured locomotives are required to certify to the applicable U.S. EPA emission standards. Locomotives are generally identified by Tier levels, including Tier 0, Tier 0+, Tier 1, Tier 1+, Tier 2, Tier 2+, Tier 3, and Tier 4. The U.S. EPA’s first set of locomotive emission standards in 1998 applied to newly manufactured and remanufactured locomotives which were originally manufactured in 1973 and later. Tier 0, Tier 1, and Tier 2 emission standards applied to locomotives originally manufactured from 1973 to 2001, 2002 to 2004, and 2005 and later, respectively. In 2008, U.S. EPA adopted more stringent emission standards (Tier 3 and Tier 4) for locomotives as well as more stringent remanufacturing standards for Tier 0, Tier 1, and Tier 2 locomotives (identified by plus signs). Tier 4 locomotives meet the most stringent emission standards which went into effect for locomotives originally manufactured in 2015 and later. There are also few remaining pre-Tier 0 locomotives still in operation which were manufactured prior to 1973 and are not subject to the U.S. EPA’s emissions standards.

Locomotive emissions associated with a freight rail yard are calculated based on the difference between activity level in non-zero emission and zero emission configurations, the corresponding emissions factors for locomotives based on locomotive type and Tier levels, and total number of operation days that the locomotive moves through a freight rail yard. For each inbound and outbound train servicing a freight rail yard, the locomotive emissions will depend on the number

---

<sup>6</sup> CARB. Truck vs. Train Emissions Analysis: <https://ww2.arb.ca.gov/resources/fact-sheets/truck-vs-train-emissions-analysis>

of line haul locomotives powering the train, locomotives activity level, make-up of train locomotives (tier levels), and associated emission factors.

The primary source of emissions attracted to freight rail yards are those associated with locomotives, which can have a long useful life. As a locomotive ages, the emission of criteria pollutants tends to worsen. In addition, an owner or operator may be averse to turn an older locomotive over into a newer cleaner model due to high upfront costs. Many owners/operators opt instead to remanufacture the engine of the locomotive, which tends to be cheaper. CARB's In-Use Locomotive Regulation includes a "Spending Account" through which the operation of older, dirtier locomotives would be required to pay more charges into an account that can be used by locomotive owners/operators to purchase newer, cleaner locomotives. Besides fleet turnover, minimizing idling and cleaning idling operations are other ways in which locomotives may lower emissions. Engines tend to be at their least efficient operational state when idling, so even when no work is being done, the engine may be generating more emissions per unit of fuel compared to in-transit operations. For this reason, owner/operators may consider zero emission engines specifically for idling time and/or standardized operating procedures to lower the times in which a locomotive may be idling. With respect to turning over to zero emission capable locomotives, they are just beginning to emerge commercially for switcher operations or in combination with diesel line haul locomotives to make a hybrid consist, and recently, hybrid hydrogen fuel cell/battery technology was used to power passenger locomotives.<sup>7</sup> Zero emission technology is anticipated to continue to develop, with multiple ongoing projects.<sup>8</sup>

## B. Drayage Trucks

Drayage truck activity associated with the freight rail yard includes trucks carrying full or empty containers and other cargo in and out of freight rail yards or traveling to and from the freight rail yard without a trailer (i.e., to drop off or pick up cargo). The off-site drayage truck emissions are associated with trucks traveling through public roads transporting cargo from off-site points of origin to the freight rail yard and from the freight rail yard to the destination points. The on-site drayage truck emissions are associated with truck idling and truck traveling within the rail yard boundary. The annual emissions for drayage trucks operating at a freight rail yard are calculated based on number of truck trips, miles traveled by the truck, and the emission factor from CARB's EMFAC2021 model. These emission factors are adjusted for CARB's Heavy-Duty Inspection and Maintenance Program and ACF regulations that are not reflected in EMFAC2021. To ensure that drayage trucks have a timely transition to zero emission alternatives, CARB adopted a "useful life" mechanism into their ACF Regulation, so that a truck is not allowed to enter intermodal rail yards

---

<sup>8</sup> For example, in 2023, the California State Transportation Agency (CalSTA) awarded grants to the South Coast AQMD for zero emission fuel cell locomotives and infrastructure, and to the Port of Long Beach to implement zero emission battery electric locomotives for port operations: <https://calsta.ca.gov/-/media/calsta-media/documents/pfip-awards-summary-narrative-7-6-23-a11y.pdf>.

or ports upon surpassing a certain mileage threshold or model year age. Zero emission trucks that can perform drayage service are now commercially available.<sup>9</sup>

### C. Transportation Refrigeration Units

Transportation refrigeration units (TRU) are diesel-powered refrigeration units that are installed on trucks, trailers, containers, and railcars operating at freight rail yards. Emissions for a TRU are calculated based on its activity data and operating parameters (i.e., number and type of TRU, engine size, model year, operating hours, and engine load), and corresponding emission factors from CARB's OFFROAD 2021 model (i.e., emission factors, deterioration rates, load factors, fuel correction factors). TRUs differ from other mobile source categories in the sense that they perform relatively consistent operations. Therefore, operational changes are not anticipated to be an effective strategy to reduce emissions. Instead, cleaner TRUs would need to be introduced, including zero emissions technologies (e.g., for TRUs that plug in while parked) or TRUs that could meet a cleaner engine standard. CARB is actively developing a new engine standard for non-truck TRUs that are most common at freight rail yards and is evaluating emerging zero emission TRU technologies.<sup>10</sup>

### D. Cargo Handling Equipment

Cargo handling equipment (CHE) refers to the on-site off-road self-propelled vehicle or equipment that is used for lifting or moving containers or bulk or liquid cargo at a freight rail yard; however, some yard trucks may be equipped with on-road engines and may travel short distance offsite. CHE equipment includes, but is not limited to, yard trucks (hostlers), forklifts, gantry cranes, top handlers, side handlers, reach stackers, aerial lifts, loaders, and other container/material handling equipment being used at freight rail yards. CHE can be equipped with diesel, gasoline, or natural gas engines or have zero emission configurations (e.g., electric/battery, hydrogen fuel cell). Diesel CHE are identified by Tier levels (Tier 0 to Tier 4) corresponding to the U.S. EPA's emission standards for new non-road diesel-powered equipment. CARB's 2005 CHE regulation established requirements for in-use and newly purchased diesel-powered CHE at ports and freight rail yards and was fully implemented by 2017. CARB has also adopted new engine emission standards and fleet requirements for large spark-ignited CHE (e.g., gasoline, propane) which have also been fully implemented.

The emissions for CHE operating at freight rail yards are calculated based on the equipment activity data (e.g., count and type of equipment, engine size, model year, annual operating hours, and fuel type) and the corresponding input parameters from CARB's OFFROAD 2021 (i.e., emission factors, deterioration rates, load factors, and fuel correction factors).

Since CHE is a broad category of equipment, some CHE categories already have commercially available zero emission alternatives (e.g., yard trucks, some container lifts)<sup>11</sup>, or zero emission

---

<sup>9</sup> Examples: Global Commercial Vehicle Drive to Zero. Zero-Emission Technology Inventory: <https://globaldrivetozero.org/tools/zeti/>; California HVIP Clean Truck and Bus Incentives. Tractor: <https://californiahvip.org/vehicle-category/heavy-duty/?type=300>.

<sup>10</sup> CARB. Zero-Emission Truck TRU Technologies: <https://ww2.arb.ca.gov/our-work/programs/transport-refrigeration-unit/compliance-information/zero-emission-truck-tru>.

<sup>11</sup> Examples: BYD 8Y Terminal Tractor: <https://en.byd.com/truck/terminal-tractor/>; Orange EV. Husk-e® Purpose-Built for Port & Rail: <https://orangeev.com/huske/>; Taylor Machine Works, Inc. Electric Lifts: <https://taylorforklifts.com/products/electric-lift-truck>.

hybrid options (e.g., rubber-tired gantries).<sup>12</sup> However zero emission technology for some categories is still developing.<sup>13</sup>

### **E. Other On-Site Support Equipment**

Other on-site support equipment (OSE) refers to any other on-site off-road self-propelled vehicle or equipment other than CHE operating at a freight rail yard. OSE include, but are not limited to, railcar movers, and railcar wheel change machines, used at freight rail yards. OSE can be equipped with diesel, gasoline, or natural gas engines or have zero emission configurations (e.g., electric/battery, hydrogen fuel cell). Like diesel CHE, diesel OSE are identified by Tier levels (Tier 0 to Tier 4) corresponding to the U.S. EPA’s emission standards for new non-road diesel-powered equipment. Off-road OSE powered by spark-ignition engines (e.g., fueled by propane, gasoline, etc.) are regulated by CARB’s Large Spark Ignition regulation, which has already been fully implemented.<sup>14</sup> Off-road OSE powered by diesel engines would be covered by CARB’s In-Use Off-Road Diesel regulation that was recently amended.<sup>15</sup>

The annual emissions for OSE operating at freight rail yards are calculated similar to annual emissions for CHE, and based on the equipment activity data (i.e., count and type of equipment, engine size, model year, annual operating hours, fuel type) and the corresponding input parameters from CARB’s OFFROAD 2021 (i.e., emission factors, deterioration rates, load factors, fuel correction factors). Similar to CHE, some zero emission technologies are starting to become available for some OSE types (e.g., railcar movers, track maintenance equipment).<sup>16</sup>

### ***CURRENT STATE REGULATIONS ADDRESSING FREIGHT RAIL YARD EMISSION SOURCES***

There have been various efforts in the past to regulate emission sources that may also be associated with freight rail yard, as illustrated in Figure 2-1. State measures and regulations for drayage trucks, CHE, and TRUs have progressively aimed for a gradual transition to zero emission vehicle fleets and equipment. Development of regulations for drayage trucks began in 2007 which aimed to reduce emissions from drayage trucks used for cargo transportation to and from California intermodal rail yards and ports. These regulatory efforts started with the Statewide Drayage Truck Regulation (2007) which sought to meet or exceed the federal heavy-duty diesel-fueled engine

Technology and Market Assessment of Zero-Emission Off-Road Equipment: [https://calstart.org/wp-content/uploads/2022/10/off\\_road\\_report\\_october\\_2022.pdf](https://calstart.org/wp-content/uploads/2022/10/off_road_report_october_2022.pdf).

standards<sup>17</sup>, followed by CARB’s recent ACF Regulation (2023) to ultimately reach 100 percent zero emission for all drayage trucks by 2035. CHE and TRU SIP measures have been established, and regulations have also been adopted and later amended in order to make standards more stringent over time and ultimately facilitate the transition of CHE and TRU to cleaner fleets.

**Figure 2-1. Regulatory History for Control of Emissions from Freight Rail Yards**

Lately state goals have focused on the need to accelerate the adoption of lower emission technologies, in particular zero emission vehicles (ZEVs) and locomotives capable of operating in zero emission configuration. Two notable examples include CARB’s recently adopted In-Use Locomotive Regulation and ACF Regulation. PR2306 is designed with these two rules in mind and aims to guarantee local emission reductions in freight rail yards at levels that are at least proportional to statewide emission reductions from implementing these state regulations. In addition to the recently adopted state regulations, CARB’s 2020 Mobile Source Strategy (MSS),<sup>18</sup> the 2022 State SIP Strategy,<sup>19</sup> and an executive order from the governor aim to accelerate the adoption of zero emission technologies.<sup>20</sup> CARB’s MSS is an integrated planning effort designed to meet state goals for criteria pollutants, greenhouse gases, and toxics. One of the key conclusions from this analysis is that a significant portion of the existing mobile source fleet (trucks, cars, off-road equipment, etc.) will need to convert to zero emission technologies quickly to meet multiple state goals, including attainment of federal air quality standards. The 2022 State SIP Strategy further describes mobile source control measures that will be needed to meet federal air quality standards. While some strategies like the In-Use Locomotive and ACF regulations have been

<sup>20</sup> State of California. Executive Order N-79-20: <https://www.gov.ca.gov/wp-content/uploads/2020/09/9.23.20-EO-N-79-20-Climate.pdf>

adopted by CARB, other strategies are still undefined and rely on as-yet unspecified “accelerated turnover to zero emission technologies” for specific emissions sources, including some associated with freight rail yards such as railcar TRUs and CHE. Further, in September 2020, the governor of California signed an executive order directing state agencies to pursue zero emission goals for mobile sources. This includes a goal of a 100 percent zero emission truck fleet by 2045, a 100 percent zero emission drayage truck fleet (e.g., trucks that visit ports and rail yards) by 2035, and 100 percent zero emission off-road equipment operations by 2035.

### Locomotives

The In-Use Locomotive Regulation was adopted by CARB in April 2023, with the final version approved through the Office of Administrative Law in October 2023.<sup>21</sup> This rule aims to reduce rail emissions in California by establishing a spending account for each locomotive operator as well as placing useful life limits on in-use locomotives. The spending account would require each locomotive operator to deposit funds annually based on the NO<sub>x</sub> and PM levels of the locomotive engines being operated in California. Between the years 2026 and 2029, funds in the spending account may only be used to purchase locomotives that meet Tier 4 emission standards or cleaner. From the year 2030 and beyond, the spending account funds may only be used to purchase zero emission capable locomotives. Funds may also be used for zero emission railcar movers, zero emission infrastructure, and pilot and demonstration projects. Beginning January 1, 2030, only locomotives less than 23 years of age may operate within the state unless operated in zero emission configuration or meeting the cleanest federal emission standards. Also starting on January 1, 2030, all new passenger, switch, and industrial locomotives with original engine build dates of 2030 or later must operate in zero emission configuration in California. Another operational requirement begins January 1, 2035, which will require all line haul locomotives with an engine build date of 2035 or later to operate in zero emission configuration when operating within the state. Lastly, the rule imposes an idling limit of 30 minutes, unless exempted, for locomotives equipped with automatic shutoff devices. There are no specific requirements in the In-Use Locomotive Regulation that apply to South Coast AQMD. As of the date of this report, the U.S. EPA has not approved the authorization request for this regulation, and CARB is not enforcing it.

There are a variety of additional flexibilities built into the In-Use Locomotive Regulation besides those described above. These include an Alternative Compliance Plan option which allows locomotive operators to reduce emissions through other strategies than described above, an Alternative Fleet Milestone Option which allows locomotive operators to reduce emissions by committing to alternative operational milestones, and Compliance Extensions for situations like delays in infrastructure installation. The result of these flexibilities is that the exact level of emission reductions in South Coast AQMD is uncertain. Locomotive operators can comply in a variety of ways, with differing results in emission reductions.

The In-Use Locomotive Regulation is the first state-level regulatory action in the U.S. Prior state efforts in reducing rail emissions relied on contractual agreements with railroads. The 1998 MOU focuses on locomotive fleet-wide average emission to meet Tier 2 emission levels or better for the Basin from 2010 through 2030. This agreement remains in effect today (see Box 2-1 for the 2020

---

<sup>21</sup> CARB. In-Use Locomotive Regulation: <https://ww2.arb.ca.gov/rulemaking/2022/locomotive>

**Box 2-1. Locomotive Fleet Composition and Average Emission Rates**

While individual Class 1 railroads operate across multiple states, the emissions profiles are not uniform. Emission levels vary by railroad and geographically. As shown in the table below, in 2020 the nationwide average locomotive tier level for all seven Class 1 railroads differs from the tier level reported by both UP and BNSF in the South Coast Air Basin.

**Class 1 Railroad Locomotive Fleet Composition by Tier Level for 2020**

Locomotive Tier	Nationwide	South Coast Air Basin*	
	All Class 1 Railroads	UP	BNSF
Not Classified	2%	0%	6%
Tier 0/0+	19%	13%	1%
Tier 1/1+	27%	34%	25%
Tier 2/2+	28%	29%	35%
Tier 3	18%	19%	26%
Tier 4	7%	5%	6%
<b>Total Count of Locomotives</b>	<b>16,787</b>	<b>4,602</b>	<b>4,927</b>

\* May not sum due to rounding

Further, even within the South Coast Air Basin, the fleet average emission rates can vary significantly between UP and BNSF. However, both railroad fleets’ average emission rates were 3-5 times higher than the cleanest federal Tier 4 standard of 1.3 g/bhp-hr.

**Average Locomotive Emission Rate in South Coast Air Basin in 2020**

Data Sources:

CARB. Reports from 1998 Locomotive NOx Fleet Average Emissions Agreement in the South Coast Air Basin (1998 MOU) <https://ww2.arb.ca.gov/resources/documents/rail-emission-reduction-agreements>

U.S. EPA. 2020 National Emissions Inventory Locomotive Methodology (using information from Association of American Railroads) [https://gaftp.epa.gov/air/nei/2020/doc/supporting\\_data/nonpoint/Rail/2020\\_NEI\\_Rail\\_062722.pdf](https://gaftp.epa.gov/air/nei/2020/doc/supporting_data/nonpoint/Rail/2020_NEI_Rail_062722.pdf)

compliance summary).<sup>22</sup> The 2005 Statewide Railyard Agreement was completed in 2015 and included a statewide idle reduction program, maximized the use of ultra-low sulfur diesel fuel,

established a statewide visible emissions reduction and repair program, as well as the preparation of emission inventories and health risk assessments for 17 major rail yards across the state.

### Drayage Trucks

CARB adopted its ACF Regulation in April 2023, and the final version of the rule was approved by the Office of Administrative Law in October 2023.<sup>23</sup> This regulation phases in zero emission vehicle requirements for state and local government fleets, drayage trucks, and high priority and federal fleets. The regulation also requires medium-duty and heavy-duty vehicle sales in California to become fully zero emission (i.e., 100 percent) starting in 2036. The ACF Regulation establishes the requirement for all drayage trucks to be registered in CARB’s reporting system. Legacy trucks, which are non-zero emission drayage trucks with a 2010 or newer engine model year, that are registered prior to 2024 will be able to remain in service until the engine age exceeds 13 years or its mileage exceeds 800,000 miles with a maximum of 18 years from the truck engine certification

#### **Box 2-2. Uneven Outcome from Statewide Truck and Bus Regulation Implementation**

CARB’s Truck and Bus Regulation required virtually all trucks to transition to model year (MY) 2010 and newer engine technology by 2023, including for drayage trucks. The MY 2010 or newer trucks use the selective catalytic reduction (SCR) technology which significantly lower NOx emissions when compared to earlier model years. The turnover of the state’s truck fleet did not necessarily happen evenly across the state. Data retrieved through CARB’s EMFAC2021 model shows a higher proportion of vehicle miles travelled by older drayage trucks in South Coast AQMD relative to various other air districts and the rest of the state in the leadup to the complete pre-MY 2010 truck phase-out in 2023. South Coast AQMD experienced a slower decrease in the activity of older drayage trucks (pre-MY 2010) relative to other air districts. There was no requirement to ensure that drayage trucks were turned over to MY 2010 or newer equally across the state in CARB’s Truck and Bus Regulation, or in any other program at the time.

<sup>22</sup> CARB. Rail Emission Reduction Agreements: <https://ww2.arb.ca.gov/resources/documents/rail-emission-reduction-agreements>

<sup>23</sup> CARB. Proposed Advanced Clean Fleets Regulation: <https://ww2.arb.ca.gov/rulemaking/2022/acf2022>

date, whichever is later. Also beginning January 1, 2024, any truck added to drayage service must be zero emission. Additionally, the ACF Regulation requires all drayage trucks entering seaports and intermodal rail yards to be zero emission by 2035. As of the date of this report, the U.S. EPA has not approved the waiver and authorization requests from CARB for ACF, and CARB is not enforcing it.

Similar to the flexibilities described above for the In-Use Locomotive Regulation, the drayage component of ACF includes flexibilities for drayage fleet owners. This includes compliance extensions such as for infrastructure delays, or vehicle delivery delays. Further, the state drayage registry includes more than 140,000 trucks, however less than 34,000 are being used at ports and rail yards.<sup>24</sup> This excess number of drayage trucks provides flexibility in conducting drayage operations with non-zero emissions trucks, even while drayage operators remain compliant with CARB's regulation. ACF also does not include any specific requirements for drayage operations in South Coast AQMD. Box 2-2 provides an example of how past implementation of statewide regulation has led to an uneven outcome across the state.

### Transportation Refrigeration Units

CARB's 2022 revisions to the Airborne Toxic Control Measures (ATCM) for In-Use Diesel-Fueled Transport Refrigeration Units (Part 1 regulation) set forth zero emission mandates for truck TRUs, with a stipulation that by December 31, 2029, all truck TRUs in California must operate with zero level of emissions. Truck TRUs typically do not visit freight rail yards. Additionally, starting in 2023, newer model trailer, container, and railcar TRUs, along with TRU generator sets, are required to adhere to a PM emission standard of 0.02 grams per brake horsepower-hour. As of the date of this report, the U.S. EPA has not approved the authorization request from CARB for the TRU Part 1 Regulation, and CARB is not enforcing it.

The 2022 State SIP strategy included a control measure to introduce zero emission requirements for non-truck TRUs, such as trailer TRUs, domestic container TRUs, railcar TRUs, and TRU generator sets. To implement this strategy, CARB has recently initiated rulemaking for the Part 2 amendments to the TRU ATCM.<sup>25</sup>

### Cargo Handling Equipment

CARB's current CHE Regulation was adopted in 2005 and was fully implemented in 2017. The 2022 State SIP Strategy for CHE will establish requirements for transitioning CHE to zero emission. Under this strategy, all yard trucks and forklifts are expected to be zero emission by 2030; rubber-tired gantry cranes will be zero emission by 2032; and 90% of other CHE would be zero emission by 2036. As of the date of this report, rulemaking has not been initiated for this strategy.

### *ZERO EMISSIONS INFRASTRUCTURE NEEDS*

As described in the previous section, many recently adopted and upcoming regulations from CARB make significant strides towards deploying zero emissions mobile sources across many

---

<sup>24</sup> CARB. Advanced Clean Fleets Regulation – Drayage Truck Requirements:  
<https://ww2.arb.ca.gov/resources/fact-sheets/advanced-clean-fleets-regulation-drayage-truck-requirements>  
<https://ww2.arb.ca.gov/resources/fact-sheets/advanced-clean-fleets-regulation-drayage-truck-requirements#:~:text=As%20of%20December%202022%2C%20there,out%20of%20state%20drayage%20trucks>

<sup>25</sup> See: <https://ww2.arb.ca.gov/our-work/programs/transport-refrigeration-unit/tru-meetings-workshops>.

sectors. One of the key challenges that is emerging with deploying zero emissions equipment and vehicles is the need to develop charging and fueling infrastructure. The scale of this challenge is illustrated when looking at what is occurring for on-road vehicles. Based on analysis by the state Energy Commission, by 2030 the state will need about 115,000 chargers by 2030 and more than 260,000 chargers by 2035 just to support medium and heavy duty on-road vehicles.<sup>26</sup> When including light-duty vehicles, the need jumps to more than 2.1 million chargers. In comparison, today there are only about 94,000 chargers across the state.<sup>27</sup>

This type of comprehensive analysis has not been completed yet for off-road vehicles; however, the scale of the challenge is expected to be similar. As an example, if in the future a freight rail yard were to charge 150 pieces of electric CHE at the same time using 100 kW chargers, they would need 15 MW of power at that site. If they were to add in charging for 5 switch locomotives at 1 MW each, the need could jump to 20 MW. Existing freight rail yards typically do not have this much power available on their local circuit and may only currently use about 1 MW. The state Energy Commission has developed web-based mapping tool (EDGE) to evaluate the local electrical grid capacity at the neighborhood level.<sup>28</sup> This EDGE tool reveals that the local grid capacity varies widely between freight rail yards. In one case for two freight rail yards near each other that are operated by two different railroads, the area around one rail yard only has less than 0.1 MW of available circuit capacity, while the area around the nearby rail yard has about 6 MW of available circuit capacity. In both cases, significant upgrades would be needed to the surrounding grid to supply the 20 MW of power in the example described above. More comprehensively, the Energy Commission determined that 89% of areas throughout the state do not have enough capacity for a single 10 MW upgrade using existing infrastructure.<sup>29</sup>

Electric utilities have stated that early planning is critical to develop this infrastructure for a site, and large projects can take more than five years to build out, although the specifics of any one particular site will vary. Hydrogen fueling infrastructure for mobile source fueling is not expected to be built through utility infrastructure, so the timelines may be somewhat less than for electrical upgrades. Regardless of fuel type, the scale of infrastructure development necessitates comprehensive planning to ensure the infrastructure is available when zero emission vehicles are first delivered for use.

Both owners and operators of freight rail yards are expected to have a role in planning for zero emissions infrastructure buildout given their shared interest in the physical layout and improvement of a facility. A general template for zero emissions planning for all freight rail yards is not expected to be a reasonable solution as specific site details are critical to developing a zero-emissions infrastructure plan. Details include evaluating how many locomotives, as well as pieces of CHE, OSE, and TRUs would need to be fueled or charged, at what rate, at which locations onsite, whether energy storage will also be included to provide redundancy and/or price moderation, what types of chargers or fueling dispensers will be used, etc.

---

<sup>26</sup> California Energy Commission. AB 2127 Report: <https://efiling.energy.ca.gov/GetDocument.aspx?tn=254869>

<sup>27</sup> California Energy Commission . Integrated Energy Policy Report: <https://efiling.energy.ca.gov/GetDocument.aspx?tn=254463>

<sup>28</sup> California Energy Commission EDGE tool: <https://experience.arcgis.com/experience/6aaadc11586447aaaeab2a473947ad07>

<sup>29</sup> California Energy Commission. AB 2127 report: <https://efiling.energy.ca.gov/GetDocument.aspx?tn=254869>

There are no existing requirements for freight rail yard owners or operators to develop comprehensive zero emissions infrastructure plans under any existing regulation or legislation, nor are they required to submit applications on any specific timelines to local utilities to begin the needed grid upgrades. This grid planning is also critical not just for their location, but for the surrounding land uses too, especially given the local circuit constraints described above. Freight rail yards are commonly located in industrial areas, and many of these other businesses will also need to upgrade their electrical service in response to state mandates for zero emissions equipment, vehicles, and potentially building space and water heating. The zero emissions infrastructure needs of a freight rail yard may be substantial relative to its neighbors; absent this analysis or visibility into such analysis, local utilities will not have a comprehensive picture of what an area needs and may not be able to efficiently provide upgrades to everyone.

By including requirements to report on the utilization of any installed and operative zero emission infrastructure, as well as zero emission infrastructure projects under design and development, the reported information will further help inform the planning of future zero-emission energy needs and the infrastructure to supply the energy.

### ***PUBLIC HEALTH AND AIR QUALITY NEEDS***

Criteria pollutants, such as ozone and PM<sub>2.5</sub> (inclusive of directly emitted diesel particulate matter which is an air toxic), are not only harmful to the environment but also to human health. Regulating NO<sub>x</sub> emissions, a precursor to ozone and secondarily-formed PM<sub>2.5</sub>, will lessen the health impacts imposed on affected communities. Certain groups of people, like outdoor workers, children, older adults, and those suffering from lung diseases or certain nutritional deficiencies are most vulnerable to ozone health effects.<sup>30</sup> Short term exposure to ozone can cause breathing problems, reduced lung capacity, increased infection risk, lung inflammation, and immune system changes. Elevated ozone levels are linked to worsened asthma and chronic obstructive pulmonary disease (COPD), respiratory infections, increased school absences, hospital visits, and higher mortality rates. Recent evidence suggests ozone may also affect metabolism, and there is some indication of effects on the cardiovascular and nervous systems, reproduction and development, and mortality, although these findings are less certain.

Studies have found connections between high levels of particulate matter and higher mortality rates, respiratory infections, asthma attacks, COPD exacerbations, and hospital admissions.<sup>31</sup> PM<sub>2.5</sub> levels are also associated with cardiovascular and respiratory disease mortality, hospital visits for respiratory issues, school absences, decreased lung function in children, and increased asthma medication use. Long-term exposure to particulate matter is linked to stunted lung function growth in children, increase cardiovascular disease risk, and higher lung cancer mortality rates. The U.S. EPA's recent review confirms that both short-term and long-term exposure to PM<sub>2.5</sub> increases cardiovascular risk and mortality.<sup>32</sup> There is also emerging evidence of metabolic, nervous system, and reproductive effects from exposure to PM<sub>2.5</sub>.

---

<sup>30</sup> South Coast AQMD. 2022 Air Quality Management Plan: <https://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2022-air-quality-management-plan/final-2022-aqmp/final-2022-aqmp.pdf?sfvrsn=16>

<sup>31</sup> *Ibid.*

<sup>32</sup> U.S. EPA. Integrated Science Assessment (ISA) for Particulate Matter: <https://www.epa.gov/isa/integrated-science-assessment-isa-particulate-matter>

The International Agency for Research on Cancer classified diesel particulate matter as likely carcinogenic to humans in 1989, and in 2012, they confirmed it as causing lung cancer. Similarly, in 1998 CARB identified diesel particulate matter as a toxic air contaminant that causes cancer and other health effects. South Coast AQMD studies on air toxics, including the Multiple Air Toxics Exposure Study (MATES) V, also identified diesel particulate matter as the largest contributor to overall air toxics cancer risk.<sup>33</sup>

The Basin has some of the worst air quality in the nation with highest levels of ozone and among the highest levels of PM<sub>2.5</sub> in the country that exceed federal air quality standards.<sup>34</sup> Attaining air quality standards yields monetized health benefits that are estimated to be about \$134.3 billion in present value cumulatively up to the year 2037.<sup>35</sup> Mobile sources associated with goods movement make up about 52 percent of all NO<sub>x</sub> emissions in the Basin.<sup>36</sup> Trucks are currently the largest source of NO<sub>x</sub> emissions in the Basin and also one of the largest sources for emissions associated with freight rail yards. The existing state and local regulations may not be sufficient to achieve air quality attainment by either 2031 or 2037 attainment dates in the Basin. Even newly proposed regulations from CARB and U.S. EPA are not guaranteed to meet these air quality standards without the support of additional actions at local scale.

PR 2306 also supports statewide efforts to increase the number of zero emission vehicles and equipment. There are many actions occurring across the State of California to increase the use of zero emission technologies to satisfy many goals, including meeting federal and state air quality standards, reducing toxics and greenhouse gas emissions, encouraging manufacturing of zero emission vehicles and equipment in the state, and reducing dependence on fossil fuels.<sup>37</sup> Air districts are authorized to contribute to such efforts through development of local regulations, such as South Coast AQMD's PR 2306. PR 2306 provides a mechanism to require owners and operators of freight rail yards to report on the planning, development, and utilization of supporting zero emission infrastructure for the anticipated deployment of zero emission vehicles and equipment to comply with or support the implementation of state regulations, and to also meet the broader federal and state decarbonization and zero emission goals. PR2306 is further necessary to ensure

that state actions to require cleaner vehicles and equipment will be implemented in the South Coast AQMD region.

### ***BASELINE EMISSIONS INVENTORY OF FREIGHT RAIL YARD***

Emission sources at freight rail yards are predominately from diesel powered vehicles and equipment that contribute to NO<sub>x</sub> emissions and impact the regional ozone and air quality of communities surrounding rail yard and communities along rail corridors. Mobile sources that are attracted to freight rail yards include locomotives, drayage trucks, CHE, TRUs, and OSE. Locomotives are known to be the largest contributors to the NO<sub>x</sub> emissions associated with freight rail yards. South Coast AQMD staff conducted a baseline emission inventory analysis on applicable freight rail yard emission sources using available data from CARB, including the EMFAC and OFFROAD models as well as data directly obtained from CARB staff. Based on the projected baseline emissions inventory, which do not include the recently adopted state regulations including the In-Use Locomotive Regulation and the ACF Regulation, locomotives account for 84 percent of NO<sub>x</sub> emissions associated with freight rail yard operations in the South Coast AQMD region in 2024. Drayage trucks come second, accounting for 12 percent in 2024. Other sources of emissions including CHE, TRU, and OSE account for 4 percent in 2024.

Figure 2-2 shows the share of associated mobile sources to freight rail yards based on the projected baseline NO<sub>x</sub> emissions in 2024 and 2037. Notable changes for the 2037 projected baseline emissions of freight rail yard sources in the South Coast AQMD region include that drayage truck NO<sub>x</sub> emissions are anticipated to lower to less than half of their projected emissions level in 2024, but locomotive NO<sub>x</sub> emissions are anticipated to remain almost unchanged, therefore ending up making a larger share out of Basin emissions associated with freight rail yards in 2037.

**Figure 2-2. South Coast Freight Rail Yard Projected Baseline NO<sub>x</sub> Emissions in 2024 (Left) and 2037 (Right) by Source Category**

The baseline inventory for locomotives is derived from CARB’s OFFROAD 2021, using data from 2025 to 2050. CHE pulled from OFFROAD 2021 are those that include “Rail” in their category name. TRU pulled include Instate genset, Out-of-State Genset, and Railcar TRU. Based on CARB’s line haul locomotive emission inventory,<sup>38</sup> switcher activity in the Basin accounts for 58 percent of statewide switcher activity and line haul locomotive activity within the Basin accounts for 17 percent of statewide line haul activity. These estimates were used to convert statewide NOx emissions baselines from CARB into a reasonable estimate for specifically the Basin. Box 2-3 provides a more detailed discussion on the locomotives deployed to the Basin for the past decade or so, based on the same historical data the baseline locomotive emission projections rely upon.

**Box 2-3. More Work Done by Dirtier Freight Locomotives Today Than a Decade Ago**

Class 1 locomotives deployed to the South Coast AQMD region belong to the nationwide fleets operated by the Union Pacific Railroad and the BNSF Railway, respectively. At the beginning of 2022, UP reported a total of 7,476 owned or leased locomotives in service nationwide, among which 4,554 units had been deployed to the Basin throughout the year; similarly, BNSF reported a total of 5,344 units deployed to the Basin, out of its fleet of 7,548 owned or leased locomotives nationwide.<sup>a,b</sup> Most of locomotives deployed to the Basin are line haul locomotives traveling in and out of the Basin or used for regional switching operations; yet, only about 17 percent of statewide line haul locomotive activities occur in the South Coast AQMD region based on CARB’s estimate. Besides lack of investment by Class 1 railroads in newer, cleaner locomotives,<sup>b</sup> the non-captive nature of the Class 1 locomotive fleets is one key factor leading to the South Coast AQMD region seeing significantly more work done (in megawatt-hours) in recent years by the dirtiest locomotives (Tier 1/1+ or dirtier) when compared to a decade ago. (See the left plot below, with the orange and brown bars depicting work done by Tier 1/1+ or dirtier locomotives.)

Despite increasingly more stringent federal locomotive standards, the Basin has not seen cleaner freight locomotive operations in aggregate (see the right plot below, with the solid blue line depicting the annual fleet average NOx emission levels of Class 1 locomotive fleets). Considering the non-captive nature of the locomotive fleet in combination of the design of statewide regulations, proportional implementation of CARB’s In-Use Locomotive Regulation may not necessarily occur in South Coast AQMD, as similarly observed for the implementation of CARB’s Truck and Bus Regulation (see Box 2-2).

**Class 1 Locomotive Fleet Activity by Engine Tier for South Coast Air Basin (2010-2022)<sup>a</sup>**

**Class 1 Locomotive Fleet Average NOx Emission Levels in the South Coast Air Basin (2010-2020)<sup>c</sup>**

<sup>b</sup> Surface Transportation Board. Annual R-1 Reports Submitted by Class 1 Railroads: <https://www.stb.gov/reports-data/economic-data/annual-report-financial-data/>.

<sup>c</sup> CARB In-Use Locomotive Regulation Initial Statement of Reasons (Figure 14): <https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2022/locomotive22/isor.pdf>

For drayage trucks baseline inventory, staff worked directly with CARB staff since the EMFAC 2021 model does not include rail drayage specific emissions category. CARB staff provided statewide emissions projection data<sup>39</sup> reflecting business as usual rail drayage emissions as well as rail drayage emissions with implementation of ACF. Rail drayage emissions are subsets of the statewide drayage emission inventory available in EMFAC 2021, including T7 POLA Class 8 (Ports of Los Angeles and Long Beach), T7 POAK Class 8 (Port of Oakland), T7 Other Ports Class 8 as well as a subset of T7 Tractor Class 8 inventory reflecting rail specific activity. These emissions projections also reflect the statewide Heavy-Duty Vehicle Inspection and Maintenance regulation for drayage trucks. Additional details on the rail drayage emission inventory will be discussed in Chapter 3 of this report.

<sup>39</sup> Data obtained from CARB staff via email correspondence from March 1, 2024.

## **CHAPTER 3 : SUMMARY OF PROPOSALS**

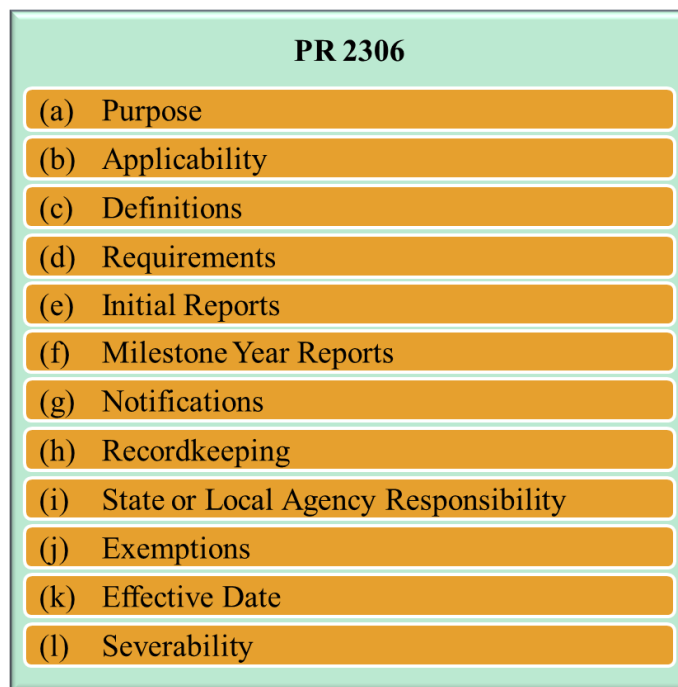

**INTRODUCTION**

**PROPOSED RULE 2306**

**PROPOSED RULE 316.2**

**INTRODUCTION**

PR 2306 works with other state and local regulations, incentive programs, and policies to enhance their effect (e.g., clean air goals and zero emission vehicle goals). PR 2306 also acts as a facilitating measure to achieve emission reductions from these other efforts. Regional reductions in NO<sub>x</sub> and PM emissions will assist in meeting federal and state air quality standards, and concurrent reductions in diesel particulate matter will also reduce air quality impacts to communities living close to freight rail yards. PR 2306 includes requirements for the operators of regulated freight rail yard to meet an emission reductions target and a corresponding facility-wide emissions reduction based on projected locomotive and truck activity. PR 2306 also requires submittal of an initial facility information report, initial zero emission infrastructure report, milestone compliance report, zero emission infrastructure status update report, as applicable, and includes recordkeeping requirements for supporting documents and data to demonstrate compliance with the proposed rule. Figure 3-1 shows the rule structure for PR 2306 as organized by subdivision and its attachments.

**Figure 3-1. Rule Structure – PR 2306**

PR 316.2 is the companion rule to PR 2306 and establishes the administrative fees that owners and operators subject to PR 2306 must pay to support South Coast AQMD compliance and implementation activities. PR 316.2 includes provisions to specify due fees for each PR 2306 report and notification, payment due dates, and charges for the returned payments made by checks. Figure 3-2 shows the rule structure for PR 316.2.

**Figure 3-2. Rule Structure – PR 316.2**

### ***PROPOSED RULE 2306***

#### **Subdivision (a) – Purpose**

The purpose of the proposed rule is to reduce local and regional emissions of NO<sub>x</sub> associated with freight rail yards and the mobile sources attracted to freight rail yards to assist in meeting applicable state and federal air quality standards in the South Coast AQMD jurisdiction. Actions required by PR 2306 serve as a local implementation of CARB’s In-Use Locomotive Regulation and ACF Regulation, to ensure local emission reductions and associated benefits are realized within South Coast AQMD.

#### **Subdivision (b) – Applicability**

PR 2306 applies to the owner or operator of any new or existing freight rail yard, or a freight rail yard proposed to be established in the future within the South Coast AQMD jurisdiction. Additionally, any state or local government agency who enters into a contractual agreement with these freight rail yards would be subject to PR 2306.

#### **Subdivision (c) – Definitions**

This subdivision includes definitions for specific terms related to freight rail yards and the corresponding mobile source activities. Some definitions are based on existing South Coast AQMD rules and regulations. Please refer to PR 2306 subdivision (c) for each specific definition.

#### ***Proposed Definitions***

Below is the list of all proposed definitions under PR 2306:

- Aggregate Emission Factor (AEF)
- Applicable Mobile Sources
- Base Period (BP)
- Cargo Handling Equipment (CHE)
- Classification Yard
- Contractual Agreement
- Drayage Trucks
- Fine Particulate Matter (PM<sub>2.5</sub>)
- Freight Rail Yard
- Freight Rail Yard Operations

- Freight Rail Yard Operator
- Freight Rail Yard Owner
- Fuel Type
- Intermodal Rail Yard
- Line Haul Locomotive
- Locomotive
- Locomotive Engine Certification Data
- Marine Terminal
- Milestone Year (MY)
- New Freight Rail Yard
- Nitrogen Oxides (NO<sub>x</sub>)
- Other On-site Support Equipment (OSE)
- Ozone
- Rail Yard
- Railcar
- Railcar Mover
- Railroad
- Rated Power
- Reference Scenario
- Responsible Official
- Shutdown
- Switch Locomotive or Switcher
- Switching Activity
- Through Traffic
- Throughput
- Transport Refrigeration Unit (TRU)
- Truck Trip
- Work Crew
- Zero Emission (ZE) Configuration
- Zero Emission (ZE) Infrastructure

### *Key Definitions*

This section provides an overview and explanation of the key definitions for the terms used in PR 2306.

#### ***Paragraph (c)(1) – Aggregate Emission Factor (AEF)***

AEF is the average rate of NO<sub>x</sub> emissions per unit of energy consumed across mobile sources attracted to a specific freight rail yard. It is used by facilities to qualify for the alternative compliance pathway by demonstrating that on average equipment used to conduct freight rail yard activities is no dirtier than during base period. Calculation of this factor is outlined in the document in PR 2306 package titled as Draft Proposed Rule 2306 Calculation Methodology.

#### ***Paragraph (c)(2) – Applicable Mobile Sources***

Mobile sources of NO<sub>x</sub> emissions that may be operated at and travel to and from a freight rail yard, including CHE, drayage trucks, line haul locomotives, switch locomotives, TRU, and OSE.

This definition does not include mobile sources such as employee vehicles, waste collection trucks, or mail delivery vehicles. Any NO<sub>x</sub> emissions from these non-applicable mobile sources are expected to be de minimis compared to NO<sub>x</sub> emissions from applicable mobile sources; moreover, these sources are not integral to day-to-day operations and have little interaction with freight rail yard operations in transporting or assisting in transporting cargo or goods.

***Paragraph (c)(3) – Base Period (BP)***

Base period for an existing freight rail yard is defined as the first two full calendar years following the end of calendar year when the rule becomes effective. Base period for a new freight rail yard includes the first two full calendar years from the start of operations at such freight rail yard. Facility operations during the base period provide a benchmark to track and compare changes in facility emissions, throughput, and fleet composition over time.

***Paragraph (c)(6) – Contractual Agreement***

Legally enforceable agreement between two or more parties to establish specified actions that may or may not be taken by either side of the agreement. For the purpose of PR 2306, a contractual agreement can be a written agreement, memorandum of understanding, or other binding agreement related to freight rail yards and their lease, construction, and/or operations. PR 2306 applies to any state or local government agency that enters into such contractual agreement with a freight yard owner or operator.

***Paragraph (c)(9) – Freight Rail Yard***

Any rail yard where switching activities occur or where cargo, which may include empty containers and chassis, are loaded or unloaded from railcars for the transportation to or from a location outside of the rail yard by locomotives operated by the rail yard operator. This includes but is not limited to intermodal rail yards and classification yards. By definition, if a rail yard operator does not operate any locomotive or operates locomotive(s) only within the rail yard property, the facility is not considered a freight rail yard for the purpose of PR 2306. For example, cargo transportation to or from industrial and on-dock rail facilities are typically carried out by locomotives operated by a contracted railroad or a third-party, and not by the facility operator. Moreover, for any locomotive that is operated by such facility operator within the rail yard property, the emission reductions from complying with the In-Use Locomotive Regulation will certainly occur at such rail yard with or without PR 2306, given the captive nature of such locomotive.

A group of rail properties or facilities that are co-located within the vicinity of each other and support the freight rail yard operations and activities by the same operator may be considered as components of one freight rail yard (please refer to the definition of “Rail Yard” for specificities). For any freight rail yard that goes through an expansion of boundaries or operations, which may result in an increase in level of activities, the proposed definition will be applicable to cover such changes and the percent emission reductions targets will apply to any increased level of emissions related to these changes.

***Paragraph (c)(10) – Freight Rail Yard Operations***

This includes all operations associated with freight rail yards that might be conducted by the operator, its contractor, a subsidiary of the operator, or a sibling company of the operator. These operations include but are not limited to switching activities, movement of cargo, fueling and maintenance repairs, and other operations by a freight rail yard operator.

***Paragraph (c)(11) – Freight Rail Yard Operator***

A freight rail yard operator is a railroad that is the entity, controls the entity, or is under common control with the entity who conducts day-to-day business operations. Such entity might use their own employees and/or hire contractor(s) to conduct day-to-day freight rail yard operations.

***Paragraph (c)(12) – Freight Rail Yard Owner***

The legal, beneficial, and/or equitable owner or group of owners of a freight rail yard. Among the known freight rail yards that are potentially subject to the rule (see Table 4-1 for the list), the freight rail yard operator often also owns the freight rail yard.

***Paragraph (c)(14) – Intermodal Rail Yard***

Any freight rail yard where cargo transportation involves two or more different modes of transportation. Operations at the intermodal rail yards that are potentially subject to the rule often involve loading, unloading, moving, and transferring cargo between railcars and trucks.

***Paragraph (c)(19) – Milestone Year (MY)***

Milestone year refers to every three calendar years starting after the calendar year that PR 2306 becomes effective. For example, if the rule becomes effective in 2027, the first milestone year would occur in 2030, the second milestone year would be 2033, the next milestone year would occur in 2036, and so on.

***Paragraph (c)(20) – New Freight Rail Yard***

New freight rail yard is any freight rail yard that begins operations or resumes operations after stopping operations for a year or longer, on or after the date that the rule becomes effective.

***Paragraph (c)(24) – Rail Yard***

Rail yard consists of one or more physical properties, such as a facility, structure, installation, or real property where railroad operations and associated railroad activities occur. For a rail yard that includes several properties, such properties may be in physical contact with each other, or separated by a roadway or other right-of-way, but are not a part of the main lines, branch lines, or other rail tracks that are used by the passing trains. An individual rail yard is owned or operated by the same entity or by entities under common control. A rail yard has one or more Work Crews assigned to conduct all day-to-day business operations associated with freight rail yards.

***Paragraph (c)(29) – Reference Scenario***

Reference scenario refers to a scenario to estimate emissions of a freight rail yard in any milestone year without the implementation of ACF Regulation, In-Use Locomotive Regulation, and PR 2306.

***Paragraph (c)(33) – Switching Activity***

One of the key characteristics of a freight rail yard is to perform switching activities. Switching activity refers to activities performed by a switch locomotive, a line haul locomotive, or a railcar mover to perform operations at the freight rail yard. These activities include classifying railcars based on cargo or destination, assembling railcars for train movement, repositioning railcars, placing locomotives and railcars in storage or to be repaired, or moving rail equipment for work service. The frequency of which switching activities occur is a factor to determine overall activity within a freight rail yard.

***Paragraph (c)(34) – Through Traffic***

Through traffic under PR 2306 is defined as continuous movement of a train that passes through and does not come to a complete stop at a freight rail yard (except for safety or emergency considerations). Rail tracks used by through traffic are not considered as part of a freight rail yard, and emissions associated with through traffic are not included as freight rail yard emissions for the purpose of PR 2306.

***Paragraph (c)(35) – Throughput***

Freight rail yard throughput is defined as the total number of visits made per railcar to a freight rail yard over a specific period of time. A railcar entering a freight rail yard and then leaving that yard counts as one visit.

***Paragraph (c)(39) – Zero Emission (ZE) Configuration***

Zero emission configuration is an operational mode for locomotives, drayage trucks, TRU, CHE, and OSE with no direct release of emissions of criteria pollutants, precursor pollutants to a criteria pollutant, or toxic air contaminants during all points of operation from any onboard source of power at any power setting. The power sources of any locomotive, vehicle, or equipment may include propulsion power and grid power. Under zero emission configuration, the corresponding locomotive, vehicle, or equipment may utilize an alternative fuel source, such as hydrogen fuel cell or battery-electric, instead of an applicable traditional fossil fuel to provide power.

***Paragraph (c)(40) – Zero Emission (ZE) Infrastructure***

Zero emission infrastructure refers to any currently operating, planned, developing, and future on-site or off-site infrastructure that provides the appropriate fuel type or power needed at a freight rail yard for operations of CHE, drayage trucks, locomotives, TRU, or OSE in zero emission configuration in support of freight rail yard compliance with PR 2306. Applicable facilities shall periodically report on the status and progress of zero emission infrastructure development as outlined in subdivisions (e) and (f).

***Subdivision (d) – Requirements***

Subdivision (d) establishes key requirements for freight rail yards subject to PR 2306, including, but not limited to, compliance with established emission reductions targets, compliance reporting requirements, and reporting on any implementation and development of zero emission infrastructure to ensure sufficient capacity for zero emission technology.

***Paragraph (d)(1) – Emission Reductions Targets***

Paragraph (d)(1) includes the requirements for freight rail yard operators to meet or exceed the emission reductions targets for each milestone year for each of the freight rail yards they operate.

***Subparagraph (d)(1)(A) – Percent NO<sub>x</sub> Emission Reductions Targets***

The operator is required to comply with emission reductions targets as specified in PR 2306 Table 1 – Emission Reductions Targets (PR 2306 Table 1). These percentage emission reductions targets are calculated using statewide baseline emissions for freight locomotives and drayage trucks, excluding the impact of CARB's In-Use Locomotive and ACF regulations, compared to the total anticipated emissions from these same emissions sources after the projected implementation of these two CARB regulations. These percent emission reductions are based on anticipated compliance scenarios presented in CARB regulatory documentation and used in PR 2306 Table 1.

Staff derived data for the emission reductions that are projected to be a direct consequence of In-Use Locomotive Regulation from the In-Use Locomotive Regulation Appendix G Table 5. Locomotive Fleet turnover projections for the In-Use Locomotive Regulation are listed in Table 3-1 for line haul locomotives and Table 3-2 for switch locomotives, which are based on percent of total work done (in MWhr).<sup>40</sup>

**Table 3-1. Statewide Line Haul Locomotive Fleet Composition Projections**

Calendar Year	Share of Statewide Line Haul Locomotive Fleet by Engine Tier (%)									
	PRE-TIER 0	TIER 0	TIER 0+	TIER 1	TIER 1+	TIER 2	TIER 2+	TIER 3	TIER 4	ZE*

2050	-	-	-	-	-	-	-	-	14.9	-	85.1

\* As defined in the CARB In-Use Locomotive Regulation, ZE locomotives includes ZE capable Locomotives which are demonstrated to operate only in ZE configuration while in California, and ZE locomotives which always operates in a ZE configuration.

<https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2022/locomotive22/fro2.pdf>

For drayage trucks baseline inventory, staff worked directly with CARB staff to refine emissions inventory for rail yard drayage from the EMFAC 2021 model (note: the same truck may perform drayage operations associated with both rail yards and ports). CARB provided rail yard specific data for NOx, PM2.5, PM10, and CO emissions from T7 Other Port Class 8, T7 POAK Class 8, T7 POLA Class 8, and Rail Drayage trucks across the state. The data provided by CARB also included both emissions projections and population/fleet turnover assumptions under the ACF Regulation. See Table 3-3 for more detail.

**Table 3-3. Statewide Drayage Truck Fleet Composition Projections  
Under the CARB ACF Regulation**

Calendar Year	Share of Statewide Drayage Truck Fleet by Fuel Type (%)		
	Electricity	Diesel	Natural Gas
2027	28.2	71.1	0.7
2028	39.2	60.1	0.7
2029	50.0	49.4	0.6
2030	64.4	35.0	0.5
2031	76.6	22.9	0.4
2032	86.0	13.5	0.4
2033	88.9	10.8	0.4
2034	92.3	7.5	0.2
2035 and after	100.0	0.0	0.0

Staff summed the baseline NO<sub>x</sub> emissions from both locomotives and drayage trucks for each calendar year (i.e., emissions before implementation of In-Use Locomotive and ACF regulations), and separately for the projected NO<sub>x</sub> emissions for locomotives and trucks after implementation of CARB regulations. The difference between baseline and projected emissions provides an estimate of the statewide projected NO<sub>x</sub> emission reductions from both In-Use Locomotive and ACF regulations each year. The default emission reductions targets specified in PR 2306 Table 1 are the percent reductions of total statewide projected NO<sub>x</sub> emissions with state regulations, compared to the total statewide baseline NO<sub>x</sub> emissions, from both locomotives and drayage trucks for each calendar year. Table 3-4 replicates PR 2306 Table 1 and lists emission reductions targets for any milestone year up to 2050 to be achieved by any freight rail yard that is applicable to PR 2306.

**Table 3-4. PR 2306 Emission Reductions Targets**

<b>Calendar Year</b>	<b>Percent Emission Reductions Targets (%)</b>
2027	9.2
2028	13.6
2029	16.9
2030	56.5
2031	61.0
2032	61.7
2033	62.3
2034	62.2
2035	71.6
2036	76.3
2037	82.4
2038	81.8
2039	81.3
2040	80.7
2041	80.0
2042	79.0
2043	77.8
2044	76.4
2045	76.0
2046	75.6
2047	74.6
2048	74.9
2049	75.7
2050	76.5

Table 3-5 includes the anticipated emission reductions within South Coast AQMD from PR 2306, in conjunction with implementation of the In-Use Locomotive and ACF regulations. As discussed earlier in Chapter 2, the two CARB regulations do not necessarily ensure uniform implementation across the state, so South Coast AQMD may not necessarily see the level of emission reductions that would result from proportional implementation of these rules. By setting emission reductions targets at the proportional level to CARB regulations, PR 2306 will ensure proportional or more-than-proportional emission reductions occur at each freight rail yard within the South Coast AQMD region. The “Total Baseline Emissions” values are estimated NO<sub>x</sub> emissions in South Coast AQMD without PR 2306, In-Use Locomotive, and ACF regulations. The “Total Controlled Emissions” are the projected NO<sub>x</sub> emissions in South Coast AQMD following the implementation

of PR 2306, In-Use Locomotive and ACF regulations. Values listed under “Emission Reductions” are the difference between “Total Baseline Emissions” and “Total Controlled Emissions” values, which shows the anticipated NOx emission reductions from implementation of PR 2306, In-Use Locomotive and ACF regulations.

**Table 3-5. Anticipated NOx Emission Reductions (tpd)**

<b>Year</b>	<b>Total Baseline Emissions</b>	<b>Total Controlled Emissions</b>	<b>Emission Reductions</b>
2027	20.1	18.3	1.8
2028	20.1	17.4	2.7
2029	20.3	16.9	3.4
2030	20.2	8.8	11.4
2031	20.2	7.9	12.3
2032	20.0	7.7	12.3
2033	19.8	7.5	12.3
2034	19.4	7.3	12.1
2035	19.0	5.4	13.6
2036	18.2	4.3	13.9
2037	17.2	3.0	14.2
2038	16.7	3.0	13.6
2039	16.0	3.0	13.0
2040	15.4	3.0	12.5
2041	15.0	3.0	12.0
2042	14.5	3.0	11.4
2043	13.9	3.1	10.8
2044	13.3	3.1	10.2
2045	13.1	3.2	10.0
2046	13.0	3.2	9.8
2047	12.8	3.3	9.6
2048	12.7	3.2	9.5
2049	12.5	3.0	9.5
2050	12.3	2.9	9.4

To estimate NOx emission reductions from freight locomotives, staff reviewed CARB’s 2021 statewide locomotives emission inventory.<sup>41</sup> CARB estimates that 58 percent of statewide switch

<sup>41</sup> CARB. 2021 Line-Haul Locomotive Emission Inventory: [https://ww2.arb.ca.gov/sites/default/files/2021-02/2021\\_line\\_haul\\_locomotive\\_emission\\_inventory\\_final.pdf](https://ww2.arb.ca.gov/sites/default/files/2021-02/2021_line_haul_locomotive_emission_inventory_final.pdf)

locomotives activity and 17 percent of statewide line haul locomotives activity take place within South Coast AQMD. Both CARB's OFFROAD 2021 and Appendix G of In-Use Locomotive Regulation separate their emissions calculations between switch and line haul locomotives.

To estimate NOx emission reductions from drayage trucks, staff reached out to CARB staff to refine rail yard specific emission inventory used in Appendix F of the ACF Regulation.<sup>42</sup> Data obtained from CARB staff reflected business-as-usual rail drayage emissions as well as rail drayage emissions with implementation of ACF Regulation. Rail drayage emissions are subsets of the statewide truck emission inventory available in EMFAC 2021, including T7 POLA Class 8, T7 POAK Class 8, T7 Other Ports Class 8 as well as a subset of T7 Tractor Class 8 inventory reflecting rail specific activity. CARB staff did not have disaggregated data for rail activity specific to South Coast AQMD jurisdiction. To apportion ACF emission reductions from South Coast AQMD, staff made the following assumptions: 1) T7 POLA Class 8 represents the majority of port drayage activity in South Coast AQMD; 2) T7 POAK Class 8 and T7 Other Ports Class 8 make up the majority of drayage activity outside of South Coast AQMD; and 3) Rail specific drayage inventory are proportionate to drayage activities of the aforementioned port inventories. Staff applied a fraction based on the proportions of the various port drayage inventories to the statewide rail drayage inventories for each calendar year to determine South Coast AQMD reductions from the ACF Regulation.

Figure 3-3 presents the Basin-wide NOx baseline emissions forecast (shown in grey bars), which reflects NOx emissions without the implementation of PR 2306, In-Use Locomotive and ACF regulations, along with the anticipated controlled emissions forecast for drayage trucks and locomotives reflecting the implementation of said regulations (shown in blue bars). It can be seen from the following figure that the NOx emissions are anticipated to decrease much faster and at a much larger magnitude compared to the baseline scenario. Steady emission reductions can be seen throughout the analyzed implementation period up to year 2050, with noticeable drops between the years 2029 to 2030 and 2034 to 2035. The drop between years 2029 and 2030 can be attributed to the CARB In-Use Locomotive Regulation requiring all switch locomotives to operate only in ZE configuration when in California, and the projected shift of in-use line haul locomotives to Tier 4 emission control technologies due to the implementation of a 23-year useful life limit. The second noticeable drop between the years 2034 to 2035 can be attributed to the implementation of ZE operation requirements for line haul locomotives from the In-Use Locomotive Regulation and full implementation of the ACF Regulation. Implementation of PR 2306 will ensure emission reductions of proportionate scale will be achieved at levels equivalent to proportional implementation of the two statewide regulations for all freight rail yards within the South Coast AQMD region.

---

**Figure 3-3. Basin-Wide NOx Emissions Forecast for Freight Rail Yard Emission Sources**

***Subparagraph (d)(1)(B) – Alternative Emission Reductions Targets***

A freight rail yard operator may use an alternative path to determine the applicable emission reductions targets to be met in lieu of the default emission reductions targets to demonstrate compliance with PR 2306. The alternative emission reductions targets present a pathway for freight rail yard operators in South Coast AQMD to comply with PR 2306 and remain consistent with compliance activities used with the In-Use Locomotive and ACF regulations. The alternative emission reductions targets specified in subparagraph (d)(1)(B) must be calculated for a single freight rail yard operator based on the operator’s actual emissions from all of their freight rail yards within the State of California in comparison to a reference scenario that captures emissions from all of their freight rail yards without including the impacts from implementation of CARB’s regulations and PR 2306.

ACF and the In-Use Locomotive regulations allow flexibility for regulated entities. They may identify ways to comply with those regulations without achieving the same level of emissions reductions as is shown in Figure 3-3. The flexibility in compliance used for CARB regulations would potentially result in less emission reductions than Table 1 in PR 2306. Therefore, freight rail yards must show that the emission reductions actually achieved are proportional or more-than-proportional to what occurred on a statewide level. If emission reductions are less than default assumptions, it is critical that South Coast AQMD (as the area with worst ozone, and the most AB 617 communities) receives its fair share of emission reductions. This alternative secures, at minimum, that statewide emission reductions that are being achieved under CARB regulations also occur proportionally within South Coast AQMD.

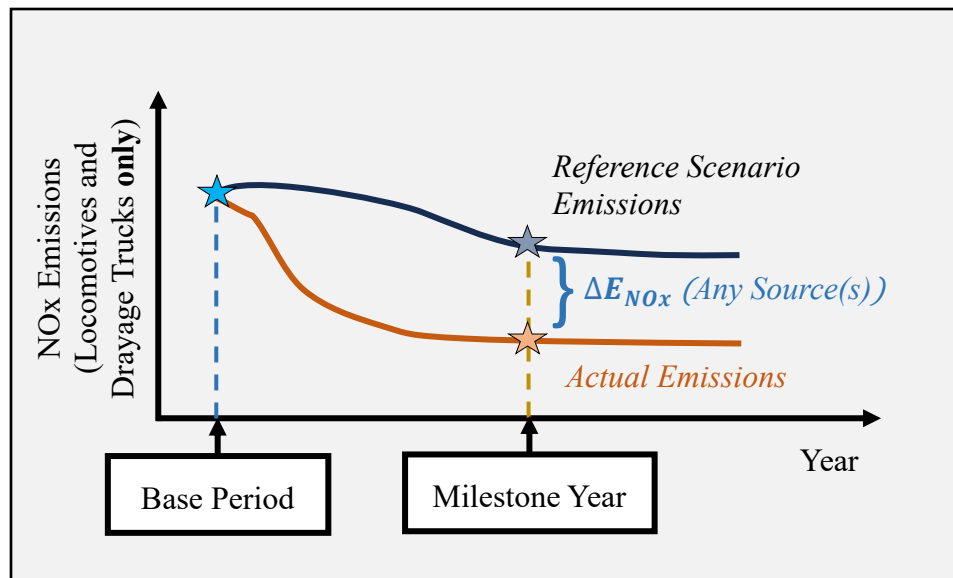

Use of alternative emission reductions targets for compliance demonstration is only available to a freight rail yard operator who has not been issued any sort of non-compliance document related to CARB’s In-Use Locomotive or ACF regulations during or prior to the reporting milestone year and also submits statewide data for all its freight rail yards in a corresponding Milestone Compliance Report. Calculation of the alternative emission reductions target for the freight rail yard using the statewide data submitted will need to be done and submitted according to the methodology in Draft Proposed Rule 2306 Calculation Methodology for a milestone year.

***Paragraph (d)(2) – Compliance with Applicable Emission Reductions Targets***

Paragraph (d)(2) states the requirement for the operator of a freight rail yard to demonstrate compliance with the applicable emission reductions targets for each milestone year as set in paragraph (d)(1) using Equation 2 in PR 2306 Appendix and the corresponding methodology specified in Draft Proposed Rule 2306 Calculation Methodology.

PR 2306 provides opportunity to obtain emission reductions from not only locomotives and drayage trucks, as seen through In-Use Locomotive and ACF regulations, but also from other mobile emission sources that are associated with freight rail yards. All compliance options in PR 2306 include an accounting of emission reductions from sources other than locomotives and drayage trucks, such as CHE, TRUs, and OSE, to achieve emission reductions targets. The additional opportunities to obtain emission reductions from CHE, TRUs, and OSE have the potential to achieve early and additional emission reductions before the implementation of CHE and TRU control measures included in the 2022 State SIP Strategy.

Figure 3-4 presents an overview of the alternative compliance pathway for PR 2306. This pathway requires operators to demonstrate that applicable emission reductions targets for each milestone year are achieved from one or more applicable mobile sources, including not only locomotives and drayage trucks, but also other mobile sources attracted to freight rail yards, such as CHE and TRU. As shown in Figure 3-4, any changes in emissions from sources other than locomotives and drayage trucks will be used to adjust the level of “*Actual Emissions*” associated with locomotives and drayage trucks. The adjusted “*Actual Emissions*” are then compared to the “*Reference Scenario Emissions*” from locomotives and drayage trucks to determine whether the percent emission target has been met or exceeded. Figure 3-4 is for illustration purpose only and does not represent an actual freight rail yard.

**Figure 3-4. Illustrative Example of Facility Compliance with Emission Reductions Targets**

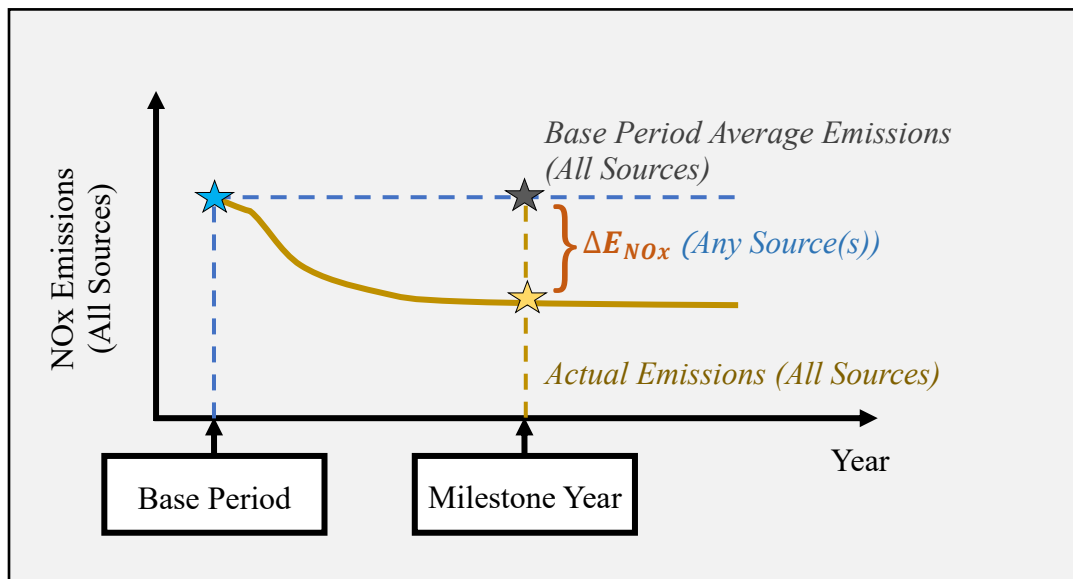

***Paragraph (d)(3) – Freight Rail Yards with Reduced Throughput from Base Period***

In order to account for a potential situation where throughput at a freight rail yard declines through time (for example, due to a national economic recession or any persistent change in operational needs), an additional option is included in the rule, as calculated based on Equation 3 in PR 2306 Appendix and its corresponding methodologies specified in Draft Proposed Rule 2306 Calculation Methodologies. Paragraph (d)(3) is only for freight rail yards with a reduced throughput during the subject milestone year and the two preceding calendar years when compared to the annual average throughput over the base period. As an illustrative example, for a 2027 milestone year, the annual average throughput for that year as well as for years 2026 and 2025 would need to be lower than the freight rail yard's reported annual average throughput during the base period as submitted in the Initial Facility Information Report. Also, a freight rail yard operator will only be able to use this option provided that the applicable mobile sources that are being used at or visit the freight rail yard do not become dirtier over the course of years following the date PR 2306 becomes effective. Therefore, to qualify for this compliance pathway, a freight rail yard operator must demonstrate that a freight rail yard's aggregate emission factor for the milestone year is less than or equal to the average emission factor reported for its base period, using the corresponding methodology specified in Draft Proposed Rule 2306 Calculation Methodology.

For a freight rail yard that qualifies for this compliance pathway, PR 2306 requires that total NOx emissions from all applicable mobile sources be compared to total NOx emissions reported by the freight rail yard operator for the base period (first two years following the date PR 2306 becomes effective), rather than comparing to a reference scenario (as established for the other two compliance pathways) to allow for incorporation of emission reductions that occurred due to the decrease in the freight rail yard's throughput. However, any emission reductions between the base period and the milestone year that are not due to reduced throughput can be obtained from any freight rail yard source(s) just as for other compliance pathways. Figure 3-5 provides an illustrative example of such a freight rail yard (this plot does not represent an actual freight rail yard). If this alternative compliance pathway is elected, a freight rail yard operator must use Equation 3 in PR

2306 Appendix and the corresponding methodology specified in Draft Proposed Rule 2306 Calculation Methodology to demonstrate in the Milestone Compliance Report its compliance with the applicable emission reductions target as established by PR 2306 paragraph (d)(1).

**Figure 3-5. Illustrative Example of Facility Compliance Through Optional Compliance Pathway Under Reduced Throughput**

#### *Paragraph (d)(4) – Submittal Requirements for Compliance Reports*

Paragraph (d)(4) outlines the submittal requirements for the four reports that any freight rail yard owner and/or operator is required to submit to the Executive Officer to comply with PR 2306. All reports are required to be signed by a responsible official of the owner or operator of the freight rail yard to confirm its accuracy and completeness.

##### *Subparagraph (d)(4)(A) – Initial Facility Information Report*

The current freight rail yard operator is required to prepare an Initial Facility Information Report and submit the report to the Executive Officer no later than 90 calendar days after the end of the freight rail yard’s base period. For a freight rail yard that is going to shut down during the base period, the former operator preceding the shutdown will have 90 calendar days after the shutdown date to submit this report to the Executive Officer.

##### *Subparagraph (d)(4)(B) – Initial Zero Emission Infrastructure Report*

The current freight rail yard owner and operator are required to prepare an Initial Zero Emission Infrastructure Report and submit the report to Executive Officer no later than 120 calendar days after the end of the freight rail yard’s base period. The submission of these reports is contingent on the end of the base period so that both new and existing freight rail yards have enough time to gather meaningful data to serve as the base period to demonstrate progress and compliance in their future periodic reports. Unlike the Initial Facility Information Report and Milestone Compliance Report, this report can be submitted for each freight rail yard individually or jointly with other freight rail yards operated by the same operator. The owner and operator are not required to submit this report for any freight rail yard that is exempt pursuant to subdivision (j).

***Subparagraph (d)(4)(C) – Milestone Compliance Report***

The current or former freight rail yard operator, as applicable, is required to prepare periodic triennial Milestone Compliance Report that is due by no later than July 15<sup>th</sup> of the calendar year following each milestone year or 90 calendar days after the freight rail yard’s shutdown date for a freight rail yard that is going to shut down during the subject milestone year.

***Subparagraph (d)(4)(D) – Zero Emission Infrastructure Status Update Report***

The current freight rail yard owner and operator are required to prepare periodic triennial Zero Emission Infrastructure Status Update Report that is due by October 15<sup>th</sup> of the calendar year following each milestone year. Infrastructure development is a process that is dependent on multiple variables, such as outside entities and technology availability; therefore, periodic reporting is more beneficial than annual reporting. This report can be submitted for each freight rail yard individually or jointly with other freight rail yards operated by the same operator to account for freight rail yards that may share zero emission infrastructure. The owner and operator are not required to submit this report for any freight rail yard that is exempt pursuant to subdivision (j).

***Paragraph (d)(5) – Need for Electrical Service Upgrade***

If the freight rail yard owner or operator states in the submitted Initial Zero Emission Infrastructure Report or Zero Emission Infrastructure Status Update Report that there is a need to upgrade the electrical service being provided to the freight rail yard, the freight rail yard owner or operator is required to submit a request to the local electrical utility to upgrade the electrical service no later than 180 calendar days after the freight rail yard owner or operator submits either of such reports.

***Paragraph (d)(6) – Other Requirements Upon Change of Freight Rail Yard Operator***

In case of any change to the freight rail yard operator, the new operator is required to obtain all information submitted by the former operator to Executive Officer as part of Initial Facility Information Report and Initial Zero Emission Infrastructure Report as well as most recent Compliance Milestone Report and Zero Emission Infrastructure Status Update Report (if any). The new operator is also required to obtain all information required to be submitted to Executive Officer as part of the next upcoming Compliance Milestone Report and Zero Emission Infrastructure Status Update Report as well as all recorded documents as stated in subdivision (h).

***Paragraph (d)(7) – Other Requirements Upon Change of Freight Rail Yard Owner***

In case of any change to the freight rail yard owner, the new owner is required to obtain all information submitted to Executive Officer as part of Initial Zero Emission Infrastructure Report as well as most recent Zero Emission Infrastructure Status Update Report (if any). The new owner is also required to obtain all information required to be submitted to Executive Officer as part of the next upcoming Zero Emission Infrastructure Status Update Report as well as all recorded documents as stated in subdivision (h).

***Paragraph (d)(8) – Other Requirements Upon Freight Rail Yard Shutdown***

In case of a freight rail yard shutdown, the freight rail yard owner is required to obtain all information submitted to Executive Officer as part of Initial Zero Emission Infrastructure Report as well as most recent Zero Emission Infrastructure Status Update Report (if any). The owner is also required to obtain all information required to be submitted to Executive Officer as part of the

next potential upcoming Zero Emission Infrastructure Status Update Report as well as all recorded documents as stated in subdivision (h).

### **Subdivision (e) – Initial Reports**

#### ***Paragraph (e)(1) – Initial Facility Information Report***

The Initial Facility Information Report provides an initial overview of the freight rail yard. The report includes a freight rail yard’s operational data required to determine emissions during the base period and to gather information that is used in calculating NOx percent emission reductions for a freight rail yard with reduced throughputs. The freight rail yard operator is required to submit all freight rail yard specific information, as specified in PR 2306 Table 2 – Freight Rail Yard Information (PR 2306 Table 2), in a manner that is truthful, accurate, and complete. All information as specified in PR 2306 Table 2 is “required” to be included in this report.

The freight rail yard operator will also need to submit information, that is either optional or required, for applicable mobile sources that are operating at and/or travelling to and from the freight rail yard as listed in PR 2306 Table 3 – Applicable Mobile Sources Information (PR 2306 Table 3). The required information is used in calculations in Equations 1 through 3 in PR 2306 Appendix and the corresponding methodologies in Draft Proposed Rule 2306 Calculation Methodology. Optional information that a freight rail yard operator may submit for locomotives include information that is required in In-Use Locomotive Regulation but not for compliance with PR 2306, while optional information that may be submitted for drayage trucks and TRUs is for data that is in lieu of using default values in calculations in Draft Proposed Rule 2306 Calculation Methodology. Also, the following information is required to be included in this report in the unit of per year for each calendar year of the freight rail yard’s base period, and as an average over the two years period of freight rail yard’s base period:

- Number of days in a calendar year when switching activities have occurred
- Freight rail yard’s annual throughput
- Aggregate emission factor as calculated using methodology in Draft Proposed Rule 2306 Calculation Methodology, including the detailed steps of the calculation.

#### ***Paragraph (e)(2) – Initial Zero Emission Infrastructure Report***

Initial Zero Emission Infrastructure Report serves as an initial overview of currently operating, planned, developing, and future on-site or off-site zero emission infrastructure in support of freight rail yard compliance with In-Use Locomotive Regulation, ACF Regulation, and/or any other ZE infrastructure requirements and initiatives, such as control measures for TRU and CHE as specified in the 2022 State Strategy for the SIP.

The freight rail yard owner and operator are required to submit zero emission infrastructure information for on-site or off-site, partially or fully complete and operative zero emission infrastructure, and include updates in designs, plans, or permitting for future projects, as listed in PR 2306 Table 4 – Information on Installed and Operative ZE Infrastructure (PR 2306 Table 4), zero emission infrastructure development as listed in PR 2306 Table 5 – Information on ZE Infrastructure in Development (PR 2306 Table 5), and information on any future zero emission infrastructure planned based on PR 2306 Table 6 – Information on Future ZE Infrastructure Being Planned (PR 2306 Table 6). The report seeks to understand the potential, capacity, and progress of zero emission infrastructure that is intended to power applicable zero emission mobile sources associated with freight rail yards within South Coast AQMD.

## **Subdivision (f) – Milestone Year Reports**

### ***Paragraph (f)(1) – Milestone Compliance Report***

Milestone Compliance Report is due for submittal every three years with the purpose for freight rail yard operators to demonstrate compliance with PR 2306 for each and every milestone year. Freight rail yard operator is required to include any changes in facility information compared to the previously submitted Initial Facility Information Report or any updated information that was submitted upon necessity as part of the most recent Milestone Compliance Report. The freight rail yard operator is required to submit specific information for applicable mobile sources operating at and travelling to and from the freight rail yard, as outlined in PR 2306 Table 3, for each milestone year, and may include optional information as specified in this table. Such information is used in Draft Proposed Rule 2306 Calculation Methodology for demonstration of compliance with the applicable percent emission reductions target for each milestone year. Optional information that may be submitted and is relevant to the calculations in the Draft Proposed Rule 2306 Calculation Methodology is data that is used in place of default values provided for drayage trucks and TRUs. The freight rail yard operator also must submit the following information in the unit of per year for every milestone year and each of the two preceding calendar years, and as an average over the three years:

- Total number of days within a calendar year when switching activities took place at the freight rail yard
- Freight rail yard’s annual throughput.

The freight rail yard operator is required to calculate the annual aggregated emission factor for any milestone year in which the freight rail yard experienced reduced throughput compared to baseline period if the operator elected to comply with paragraph (d)(3) in lieu of paragraph (d)(2).

The freight rail yard operator must declare in each Milestone Compliance Report their elected compliance pathway and include the attestation of eligibility (if applicable). The freight rail yard operator may use a different compliance pathway each milestone year. Detailed calculations pursuant to Draft Proposed Rule 2306 Calculation Methodology must also be submitted for calculations of percent emission reductions targets (if applicable) and calculations that demonstrate compliance with the chosen compliance pathway and percent emission reductions target.

The freight rail yard operator who elects to comply with the applicable alternative emission reductions target must submit statewide data and information, as outlined in PR 2306 Table 3, for drayage trucks and locomotives that operate at and travel to and from any of the freight rail yards operated by the same operator in California for the subject milestone year.

### ***Paragraph (f)(2) – Zero Emission Infrastructure Status Update Report***

Zero Emission Infrastructure Status Update Reports serve as updates on zero emission infrastructure that supports compliance with In-Use Locomotive Regulation, implementation of ACF Regulation, or any other zero emission infrastructure to present any changes since submission of Initial Zero Emission Infrastructure Report or the previously submitted Zero Emission Infrastructure Status Update report, whichever is later at time of report submittal. The freight rail yard owner and operator are required to include in this report: 1) information pertaining to installed and operative on-site or off-site zero emission infrastructure (as specified in PR 2306 Table 4); 2) updates on new or ongoing on-site or off-site zero emission infrastructure projects currently under development (as specified in PR 2306 Table 5); and 3) updates on planning of future on-site and

off-site zero emission infrastructure that are needed in the implementation and compliance of CARB’s regulations, as well as the control measures for TRUs and CHE as specified in the 2022 State Strategy for the SIP (as specified in PR 2306 Table 6).

### **Subdivision (g) – Notifications**

Subdivision (g) proposes five different notifications to be submitted to the Executive Officer in compliance with PR 2306. These are: Change of Freight Rail Yard Operator Notification, Change of Freight Rail Yard Owner Notification, Freight Rail Yard Shutdown Notification, Exceedance of Low Activity Exemption Threshold Notification, and Proposed Freight Rail Yard Construction, Conversion, or Expansion Notification.

#### ***Paragraph (g)(1) – Change of Freight Rail Yard Operator Notification***

The owner or current operator of the freight rail yard is required to submit a Change of Freight Rail Yard Operator Notification to the Executive Officer upon the change of operator at least 30 calendar days prior to the change date and includes specified information. Such information includes, but is not limited to, all anticipated changes from initial reports or the most recent Milestone Compliance Report (if applicable). A secondary notification is required to be submitted by the new freight rail yard operator to the Executive Officer within 30 calendar days after the change occurred to confirm the validity of the information submitted by the owner or previous operator in the initial notification. This notification helps to ensure that the proper party is under legal obligation for PR 2306.

#### ***Paragraph (g)(2) – Change of Freight Rail Yard Owner Notification***

The current owner or operator of the freight rail yard is required to submit a Change of Freight Rail Yard Owner Notification upon the change of owner at least 30 calendar days prior to the change date and includes specified information. Such information includes, but is not limited to, all anticipated changes from initial reports or the most recent Milestone Compliance Report (if applicable). A secondary notification is required to be submitted by the new freight rail yard owner to the Executive Officer within 30 calendar days after the change of owner occurred to confirm the validity of the information submitted by the previous owner in the initial notification. This notification, like the Change of Freight Rail Yard Operator Notification, helps to ensure that the proper party is under legal obligation for PR 2306.

#### ***Paragraph (g)(3) – Freight Rail Yard Shutdown Notification***

At least 30 calendar days before the date a freight rail yard is scheduled to shut down, the current owner or operator must submit a Freight Rail Yard Shutdown Notification to the Executive Officer with information on the freight rail yard name and address, date of the freight rail yard shutdown, reason for cessation of operation, and any anticipated date for the freight rail yard to resume operations, if applicable. This notification ensures that South Coast AQMD is aware of when a freight rail yard ceases operation and therefore, may no longer be obligated to comply with PR 2306.

#### ***Paragraph (g)(4) – Exceedance of Low Activity Exemption Threshold Notification***

The operator of a freight rail yard, previously exempt from compliance with specific provisions of PR 2306 due to meeting specified “low activity exemption” criteria, that exceeds the annual switching activity threshold specified in PR 2306 paragraph (j)(1) in any calendar year must submit an Exceedance of Low Activity Exemption Threshold Notification to the Executive Officer no

later than January 31<sup>st</sup> of the following calendar year. The operator is required to include specific information including, but not limited to, the number of days the freight rail yard performed switching activities during the previous calendar year. This notification was developed with the intention of ensuring that any freight rail yard that had previously been exempted from specific provisions of the rule, complies with the rule once it no longer meets applicable criteria to qualify for such an exemption.

#### ***Paragraph (g)(5) – Proposed Freight Rail Yard Construction, Conversion, or Expansion Notification***

The Proposed Freight Rail Yard Construction, Conversion, or Expansion Notification must be submitted to the Executive Officer no later than 365 calendar days prior to construction, conversion of a facility to a new freight rail yard, or expansion of an existing freight rail yard. Though, the notification must be submitted as soon as possible if the proposed freight rail yard occurs within 365 calendar days from the rule’s effective date. As part of the notification, the owner must submit the proposed project type and name, location, freight rail yard owner, anticipated freight rail yard operator, and the estimated date when the freight rail yard will begin operations. This notification ensures that South Coast AQMD is aware of a new freight rail yard that will be subject to PR2306.

#### **Subdivision (h) – Recordkeeping**

Subdivision (h) requires all records and supplementary documents that may support the accuracy and validity of information required to be submitted in compliance with PR 2306 to be kept by the owner or operator of the freight rail yard for a minimum of seven years from submittal deadline. Records and documentations are to be made available to the Executive Officer upon written request if they are needed in the process of reviewing submitted reports and notifications.

#### **Subdivision (i) – State or Local Agency Responsibility**

Subdivision (i) provides another layer of enforceability through contractual agreements that may be made between a freight rail yard owner/operator and state or local government agencies in relation to the lease, operation, or construction of the freight rail yard. This subdivision requires the inclusion of provision(s) that have the effect of requiring the contracted freight rail yard owner or operator to comply with PR 2306. The provision(s) may incorporate the entirety of PR 2306, the specific requirements as listed in this subdivision, or contain a more generic language that require the contracted freight rail yard owner or operator to comply with all applicable regulations and rules, inclusive of South Coast AQMD rules.

#### **Subdivision (j) – Exemptions**

##### ***Paragraph (j)(1)***

A freight rail yard owner or operator would be exempt from PR 2306 requirements specified under this paragraph due to low activity level at a freight rail yard that is not an intermodal rail yard and switching activities occur no more than 30 calendar days per year during any milestone year and each of the two calendar years preceding that milestone year. This exemption does not apply across the entire length of rule implementation, but only for years that this criterion is met. It is possible for a freight rail yard to be exempt from the mentioned provisions when reporting is due for a specific milestone year but be subject to them for the next milestone year. The owner or operator of a freight rail yard that meets the criteria of this exemption is not exempt from the mentioned provisions and requirements for any other freight rail yard that they own and/or operate that does not meet such criteria.

### ***Paragraph (j)(2)***

Certain freight rail yards that are owned or operated by City of Long Beach or City of Los Angeles through their respective harbor departments, as well as if operated by a third party under contractual operating agreement with these cities through their harbor departments, will not be subject to PR 2306 if the freight rail yard meets specific criteria. The exempted port-owned/operated freight rail yards include any intermodal rail yard located on dock at a marine terminal within the Los Angeles or Long Beach Harbor Districts.<sup>43,44</sup> Additionally, any other port-owned/operated freight rail yard that is not an intermodal rail yard and whose operations are limited to moving railcars to and/or from marine terminals located within the Los Angeles or Long Beach Harbor Districts is also exempt from compliance with PR 2306. Emissions associated with these exempted freight rail operations will be addressed in the implementation of the Facility Based Mobile Source Measure for marine ports.

### **Subdivision (k) – Effective Date**

PR 2306 will become effective following the latest out of the following dates:

- The date U.S. EPA approves PR 2306 to be included as part of the California SIP
- The date U.S. EPA grants an authorization to CARB In-Use Locomotive Regulation
- The date U.S. EPA grants an authorization or waiver for CARB ACF Regulation (such that at least the Drayage Truck Requirement is authorized)

### **Subdivision (l) – Severability**

#### ***Paragraph (l)(1)***

If a court holds portions of PR 2306 as invalid or unenforceable, the other provisions of the rule remain fully applicable and enforceable.

#### ***Paragraph (l)(2)***

Inapplicability of a provision to specific party or circumstance does not preclude other party(s) and circumstance(s) from that provision.

#### ***Paragraph (l)(3)***

If a federal a court rules to reject or delay the inclusion of PR 2306 (whether in part or as a whole) in the California SIP, the extent of rule enforceability under state law will be consistent with rule enforceability under federal law as recognized by U.S. EPA.

### **Appendix – PR 2306 Equations**

This appendix outlines the methodologies to calculate the percent reduction of NOx emissions for freight rail yards to demonstrate compliance with PR 2306. Specifically, the following subsections describe the methodologies for percent emission reductions calculations for: 1) Alternative

---

<sup>43</sup> The Los Angeles Harbor District is defined in the City of Los Angeles Charter and Administrative Code, Section 651(a): [https://codelibrary.amlegal.com/codes/los\\_angeles/latest/laac/0-0-0-3202](https://codelibrary.amlegal.com/codes/los_angeles/latest/laac/0-0-0-3202). Information on the tidelands and submerged lands granted by the State of California to the City of Los Angeles can be found at: <https://www.slc.ca.gov/granted-public-trust-lands/grantees/city-and-port-of-los-angeles/>.

<sup>44</sup> Information on the tidelands and submerged lands granted by the State of California to the City of Long Beach can be found at: <https://www.slc.ca.gov/granted-public-trust-lands/grantees/city-of-long-beach/>.

Milestone Year Reduction Target; 2) Percent NO<sub>x</sub> Emission Reductions for Any Given Milestone Year, and 3) Percent NO<sub>x</sub> Emission Reductions Between a Milestone Year and the base period.

### **Section 1 – Alternative Milestone Year Emission Reductions Target**

This section provides the methodology to calculate the alternative milestone year emission reductions target for a freight rail yard, using Equation 1 in PR 2306 Appendix and its corresponding methodology in Draft Proposed Rule 2306 Calculation Methodology, as an alternative to PR 2306 Table 1. The alternative NO<sub>x</sub> emission reductions target for each milestone year is based on the statewide emission reductions achieved from all locomotives (line haul and switcher) and drayage trucks operating at all freight rail yards, operated by the same freight rail yard operator, within the State of California. This alternative statewide emission reductions target is calculated based on the actual NO<sub>x</sub> emissions from locomotives and drayage trucks using the methodologies specified in Section 1 in Draft Proposed Rule 2306 Calculation Methodology, and the reference scenario NO<sub>x</sub> emissions from locomotives and drayage trucks using the methodologies specified in Section 2 in Draft Proposed Rule 2306 Calculation Methodology. Calculation of the alternative emission reductions target for the freight rail yard using the statewide data submitted will need to be done and submitted using Equation 1 in PR 2306 Appendix and the corresponding methodology in Draft Proposed Rule 2306 Calculation Methodology.

### **Section 2 – Percent NO<sub>x</sub> Emission Reductions for Any Given Milestone Year**

This section provides the methodology to calculate the percent emission reductions achieved for a freight rail yard within South Coast AQMD for any milestone year using Equation 2 in PR 2306 Appendix and its corresponding methodology in Draft Proposed Rule 2306 Calculation Methodology for compliance reporting purposes. The NO<sub>x</sub> emission reductions achieved for the freight rail yard for each milestone year is calculated based on the actual emissions and the reference scenario emissions from locomotives and drayage trucks operating at and travelling to and from the freight rail yard using the methodologies specified in Sections 1 and 2 in Draft Proposed Rule 2306 Calculation Methodology, respectively. Under this methodology, emission reductions achieved from CHE, TRU, and OSE operating at and/or traveling to and from the freight rail yard can be applied in meeting the applicable targets based on the methodologies specified in Sections 1 and 2 in Draft Proposed Rule 2306 Calculation Methodology. The emission reductions from CHE, TRU, and OSE are calculated based on the difference between the actual emissions from these categories and the reference scenario emissions reflecting baseline emissions for each milestone year. The estimated emission reductions from sources other than locomotives and drayage trucks will be then used to adjust the level of “actual emissions” associated with locomotives and drayage trucks. The adjusted “actual emissions” are then compared to the “reference scenario emissions” from locomotives and drayage trucks to determine whether the percent emission target has been met or exceeded.

### **Section 3 – Percent NO<sub>x</sub> Emission Reductions Between a Milestone Year and the Base Period**

This section provides the methodology to calculate the percent emission reductions achieved for a freight rail yard within South Coast AQMD for which the annual throughput in the milestone year is lower than the throughput in the base period using Equation 3 in PR 2306 Appendix and its corresponding methodology in Draft Proposed Rule 2306 Calculation Methodology. For the existing freight rail yards, the base period refers to the first two calendar years following the calendar year when PR 2306 becomes effective. For new freight rail yards, the base period refers to the first two calendar years following the calendar year when the freight rail yard begins its

operations. The freight rail yard with a lower throughput compared to the base period can opt to calculate its NOx emission reductions achieved for the milestone year using this methodology in lieu of using the methodology for Equation 2 in PR 2306 Appendix which allows for incorporation of emission reductions that occurred due to the decrease in the freight rail yard's throughput. To be eligible for this compliance pathway, freight rail yard operators are also required to demonstrate that the aggregate emission factor (AEF), described in Section 3 in Draft Proposed Rule 2306 Calculation Methodology, for the freight rail yard in the milestone year is lower than the AEF in the base period to determine whether dirtier equipment dirtier than base period has been used. The NOx emission reductions achieved under this methodology are calculated based on the actual NOx emissions for the milestone year and the actual NOx emissions over the base period (average of two years) from all applicable mobile sources operating at and travelling to and from the freight rail yard (locomotives, trucks, CHE, TRU, OSE) using the methodologies specified in Section 1 in Draft Proposed Rule 2306 Calculation Methodology. Any emission reductions between the base period and the milestone year that are not due to reduced throughput can be obtained from any freight rail yard source(s) just as for other compliance pathways.

**PROPOSED RULE 316.2****Subdivision (a) – Purpose**

The purpose of the PR 316.2 is to act as a companion rule PR 2306 and establishes the administrative fees to recover South Coast AQMD's reasonable costs associated with ensuring compliance with PR 2306.

The proposed purpose is as follows:

*Health and Safety Code Section 40522.5 provides authority for the South Coast Air Quality Management District to adopt a fee schedule for areawide or indirect sources of emissions which are regulated, but for which permits are not issued, to recover the costs of programs related to these sources. The purpose of this rule is to recover the South Coast AQMD's cost of implementing Rule 2306.*

**Subdivision (b) – Applicability**

Freight rail yard owners and operators subject to reporting and notification requirements of PR 2306 will also be subject to the respective fees of PR 316.2. As the fees of PR 316.2 are tied to specific reports and notifications, freight rail yard owners and operators may be required to pay multiple fees under PR 316.2 in any one year, then potentially not be subject to fees in the following year if they are not required to submit any of the applicable reports or notifications.

The proposed applicability is as follows:

*This rule applies to owners and operators of proposed, new, and existing Freight Rail Yards subject to Rule 2306 that submit an Initial Facility Information Report, Initial Zero Emission Infrastructure Report, Milestone Compliance Report, Zero Emission Infrastructure Status Update Report, Change of Freight Rail Yard Operator Notification, Change of Freight Rail Yard Owner Notification, Freight Rail Yard Shutdown Notification, Exceedance of Low Activity Exemption Threshold Notification, or Proposed Freight Rail Yard Construction, Conversion, or Expansion Notification.*

**Subdivision (c) – Definitions**

PR 316.2 includes definitions of specific terms related to the railroad industry and aspects of implementing PR 2306. Most definitions refer to definitions within PR 2306. Please refer to PR 316.2 subdivision(c) for each specific definition.

**Proposed Definitions:**

- Exceedance of Low Activity Exemption Threshold Notification
- Freight Rail Yard
- Freight Rail Yard Operator
- Freight Rail Yard Owner
- Freight Rail Yard Shutdown Notification
- Initial Change of Freight Rail Yard Operator Notification
- Initial Change of Freight Rail Yard Owner Notification
- Initial Facility Information Report
- Initial Zero Emission Infrastructure Report
- Milestone Compliance Report

- Proposed Freight Rail Yard Construction, Conversion, or Expansion Notification
- Secondary Change of Freight Rail Yard Operator Notification
- Secondary Change of Freight Rail Yard Owner Notification
- Zero Infrastructure Status Update Report

### ***Key Definitions:***

This section provides an overview and explanation of the key definitions for the terms used in PR 316.2.

#### ***Paragraph (c)(1) – Exceedance of Low Activity Exemption Threshold Notification***

Notification submitted by the freight rail yard operator to the Executive Officer no later than January 31 of the calendar year after a freight rail yard exceeds the annual switching activity threshold. Notification requirements are specified in PR 2306.

#### ***Paragraph (c)(5) – Freight Rail Yard Shutdown Notification***

Notification submitted by freight rail yard owner or operator to the Executive Officer no later than 30 calendar days before the freight rail yard shutdown date. Notification requirements are specified in PR 2306.

#### ***Paragraph (c)(6) – Initial Change of Freight Rail Yard Operator Notification***

Notification submitted by the freight rail yard owner or current operator to the Executive Officer no later than 30 calendar days before a change of operator. Notification requirements are specified in PR 2306.

#### ***Paragraph (c)(7) – Initial Change of Freight Rail Yard Owner Notification***

Notification submitted by the freight rail yard owner or operator to the Executive Officer no later than 30 calendar days before a change of ownership. Notification requirements are specified in PR 2306.

#### ***Paragraph (c)(8) – Initial Facility Information Report***

Report prepared and submitted by the freight rail yard operator for each freight rail yard to include information about facility and applicable mobile sources during the base period. Reporting information requirements are specified in PR 2306.

#### ***Paragraph (c)(9) – Initial Zero Emission Infrastructure Report***

Report prepared and submitted by the freight rail yard owner and operator for freight rail yard(s) with information regarding zero emission infrastructure during the base period. Reporting information requirements are specified in PR 2306.

#### ***Paragraph (c)(10) – Milestone Compliance Report***

Report prepared and submitted by the freight rail yard operator for every milestone year to demonstrate compliance with PR 2306 and includes information about any changes in facility information compared to the Initial Facility Information Report or the last submitted Milestone Compliance Report as well as information about applicable mobile sources and activity at the freight rail yard during the subject milestone year and its two preceding years. Reporting information requirements are specified in PR 2306.

***Paragraph (c)(11) – Proposed Freight Rail Yard Construction, Conversion, or Expansion Notification***

Notification submitted by the owner of the proposed freight rail yard project to the Executive Officer if there is construction or conversion of a new freight rail yard or expansion of an existing freight rail yard. Notification requirements are specified in PR 2306.

***Paragraph (c)(12) – Secondary Change of Freight Rail Yard Operator Notification***

A secondary notification submitted by the new freight rail yard operator to the Executive Officer no later than 30 calendar days after a change of operator. Notification requirements are specified in PR 2306.

***Paragraph (c)(13) – Secondary Change of Freight Rail Yard Owner Notification***

A secondary notification submitted by the new freight rail yard owner to the Executive Officer no later than 30 calendar days after a change of ownership. Notification requirements are specified in PR 2306.

***Paragraph (c)(14) – Zero Infrastructure Status Update Report***

Report prepared and submitted by the freight rail yard owner and operator for every milestone year to report any updates and new information regarding zero emission infrastructure between the milestone year and the Initial Zero Emission Infrastructure Report or the previous Zero Emission Infrastructure Status Update report, whichever is later. Reporting information requirements are specified in PR 2306.

**Subdivision (d) – Fees for Rule 2306 Reports and Notifications**

Fees established in this subdivision are set at a flat rate that is equal to the level of effort required by South Coast AQMD staff to review and process submitted documents (i.e., report or notification) for which the fees are being paid. Related tasks to be conducted by South Coast AQMD staff include, but are not limited to, processing and reviewing submitted reports or notifications, auditing emission calculations, and inspecting facilities. Applicable fees must be paid at the time that the report must be submitted pursuant to PR 2306.

**Subdivision (e) – Payment Due Date**

Payment of all applicable fees in subdivision (d) are due at the time of applicable report or notification submittal pursuant to PR 2306.

Report and notification fee payments shall be considered timely received when the full payment is delivered, postmarked, or electronically paid on or before the payment due date. If the payment due date falls on a Saturday, Sunday, or a state holiday, the full fee payment may be delivered, postmarked, or electronically paid on the next business day following the Saturday, Sunday, or the state holiday with the same effect as if it had been delivered, postmarked, or electronically paid on the payment due date. Requirements for payments in this subdivision are consistent with other South Coast AQMD fee programs in Rule 301.

**Subdivision (f) – Service Charge for Returned Check**

Freight rail yard owner or operators shall incur a \$25 service charge fee for any checks submitted on insufficient funds or on instructions to stop payment on the check.

## **CHAPTER 4 : IMPACT ASSESSMENT**

**INTRODUCTION**

**COST IMPACTS**

**HEALTH BENEFITS**

**SOCIOECONOMIC IMPACT ASSESSMENT**

**CALIFORNIA ENVIRONMENTAL QUALITY ACT**

**DRAFT FINDINGS UNDER HEALTH AND SAFETY CODE SECTION  
40727**

**COMPARATIVE ANALYSIS**

## ***INTRODUCTION***

PR 2306 will reduce regional emissions of NO<sub>x</sub> that are associated with the operation of freight rail yards. The proposed rule requires freight rail yard operators to meet or exceed established emission reductions targets. Compliance with PR 2306 includes requirements for reporting and recordkeeping for the specified base period and milestone years by the rule, as well as occasional notifications of specified events. Freight rail yards will also be required to provide informational updates on the development of zero emission infrastructure components. This chapter provides an overview of potential impacts associated with implementation of PR 2306 and PR 316.2. Throughout this chapter, the impacts are analyzed based on the assumption that PR 2306 would become effective in 2024, with 2027 being the first milestone year for freight rail yards to report and demonstrate emission reductions.

## ***AFFECTED FACILITIES***

The owners and operators of freight rail yards within the South Coast AQMD jurisdiction are subject to PR 2306 and PR 316.2. These freight rail yards are typically owned and operated by Class I freight railroads (North American Industry Classification System (NAICS) Code: 482111), namely Union Pacific (UP) Railroad and Burlington Northern Santa Fe (BNSF) Railway. In some instances, however, the freight rail yard owner is a state or local government agency (NAICS: 92). One such example is the Intermodal Container Transfer Facility (ICTF), which is owned by the ICTF Joint Powers Authority, and leased to and operated by UP.

Some freight rail yards, specifically intermodal rail yards, receive inbound trains and trucks delivering freight (e.g., containers, bulk cargo, autos, etc.) from port terminals, warehouses, distribution centers, industrial facilities, etc. The freight from inbound trains on railcars and from trucks are unloaded from one mode of transportation, loaded to another mode of transportation, and then transported from the freight rail yard by outbound trains and trucks to their next destinations. Other freight rail yards, such as classification yards, are primarily used for switching operations where railcars are classified, separated, grouped, or moved with the purpose of transporting freight on railcars to different destinations. In addition to handling freight, other activities at freight rail yards can include locomotive fueling, locomotive engine testing, rail service, and various locomotives, container, and rail yard equipment maintenance activities.

Table 4-1 lists 25 known freight rail yards that will be potentially affected by PR 2306 and PR 316.2 and their operators, and Figure 4-1 shows the approximate locations of these freight rail yards. They include Commerce Eastern, Hobart, Kaiser, La Mirada, Malabar, Pico Rivera, San Bernardino, Sheila, and Watson which are operated by BNSF, and 4<sup>th</sup> Street, Anaheim, Arlington, City of Industry, Dolores, East Los Angeles, ICTF, Inland Empire, LATC, Los Nietos, Mira Loma, Montclair, Montebello, Santa Fe Springs, and West Colton, which are operated by UP. However, this is not an exhaustive list of all freight rail yards potentially subject to PR 2306 and PR 316.2. There are possibly additional freight rail yards that could be potentially affected by the proposed rules, even though they are likely smaller in terms of footprint and/or activity levels. For the purpose of conducting the impact assessment detailed in this chapter, the analysis will be based on the aforementioned 25 freight rail yards.

**Table 4-1. Potentially Affected Freight Rail Yards**

<b>Freight Rail Yard</b>	<b>Components</b>	<b>Location</b>	<b>Operator</b>
<b>4<sup>th</sup> Street</b>	4 <sup>th</sup> Street Yard	Los Angeles, CA 90033	Union Pacific
<b>Anaheim</b>	Anaheim Yard	Anaheim, CA 92802	Union Pacific
<b>Arlington</b>	Arlington Yard	Riverside, CA 92504	Union Pacific
<b>City of Industry</b>	City of Industry Intermodal Terminal	17225 Arenth Avenue, City of Industry, CA 91748	Union Pacific

***COST IMPACTS*****PR 2306 Compliance Cost Analysis**

This section provides an analysis of compliance costs associated with anticipated implementation of PR 2306. Because PR 2306 is designed to achieve emission reductions at levels that are proportional or more-than-proportional to implementation of statewide regulations within the South Coast AQMD relative to the state as a whole, and to be consistent with these state regulations, the potential adoption and subsequent implementation of PR 2306 are expected to result in similar costs already analyzed by CARB for the state regulations<sup>45,46</sup> proportioned to the South Coast AQMD region. Beyond these costs, only nominal incremental costs are anticipated for freight rail yards to meet or exceed the proposed emission reductions targets, since most of the costs will be incurred anyway due to the implementation of the CARB regulations. However, for informational purposes, this section presents an analysis of costs based on the scenario of CARB regulations being proportionally implemented within South Coast AQMD. Additional costs associated with reporting and notification requirements of PR 2306 are outlined later in this section.

To estimate the South Coast AQMD region-specific portion of compliance costs from statewide regulations, the statewide cost estimates presented in CARB's In-Use Locomotive and ACF regulations cost analyses are scaled according to the South Coast AQMD region's estimated share of expected NOx

**Box 4-1. Cost-Effectiveness of Reducing NOx Emissions from Freight Rail Yard Sources**

South Coast AQMD routinely conducts cost-effectiveness analyses regarding proposed rules and regulations that result in the reduction of criteria pollutants. The analysis is generally used to compare and rank control measures or alternative means of emissions control in relation to the costs to achieve the projected emission reductions. A systematic cost-effectiveness analysis was conducted for the 2022 AQMP control measures in the associated Socioeconomic Report, including for several CARB measures affecting freight rail yard sources.<sup>a</sup>

The differences in the history of regulatory actions for locomotives in comparison to drayage trucks, CHE, and TRUs contribute to the result of this analysis showing the locomotive measure being more cost-effective than measures affecting other freight rail yard sources. Since the mid-2000s, CARB has adopted and amended in-use requirements or more-stringent-than-federally-required standards for these other sources; as a result, they have incurred compliance costs along the way to become cleaner over time, resulting in higher incremental costs per ton of NOx reductions.

In comparison, CARB's In-Use Locomotive Regulation is the first state regulatory action in its kind to address locomotive emissions. Today, only 5 percent of locomotives operated in the Basin meet the cleanest federal standard of Tier 4, with over 40 percent being Tier 1/1+ or dirtier.<sup>b</sup> As estimated in the 2022 AQMP, the cost of reducing one ton of NOx from locomotives ranges between \$30,000 and \$50,000 (varying by cost-effectiveness analysis method), which is considerably lower than values estimated for measures affecting other freight rail yard sources using the same methods.

<sup>46</sup> CARB. Public Hearing to Consider the Proposed Advanced Clean Fleets Regulation, Staff Report: Initial Statement of Reasons: <https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2022/acf22/isor2.pdf>.

reductions relative to the statewide total (see Table 4-2). These calculations are performed separately for locomotives and drayage trucks, using scaling factors specific to each of these equipment types. Although the emission reductions targets set in PR 2306 are based on relative (percent) statewide emission reductions from state regulations addressing emissions from locomotives and drayage trucks, PR 2306 provides compliance flexibility that allows emission reductions related to TRUs, CHE, and OSE to contribute to a freight rail yard's compliance with PR 2306. Given emission reductions from TRUs, CHE, and/or OSE are an added option that may be, but not necessarily needs to be, elected by freight rail yards, it can be reasonably assumed that this option would be elected only if it is less costly. Therefore, to be conservative, this analysis focuses on quantifying the South Coast AQMD portion of compliance costs estimated for CARB's In-Use Locomotive and ACF regulations. Moreover, as discussed in Box 4-1, it was estimated for the 2022 AQMP control measures that, in general, it would be on average more costly to reduce one ton of NOx from TRUs and CHE than from locomotives.

It should be emphasized that the percent emission reductions targets specified in Table 1 of PR 2306 are derived based on CARB's projected statewide NOx reductions (as shown in the "Statewide" columns in Table 4-2) relative to the projected statewide baseline emissions. The statewide costs quantified in CARB's analyses are for the same projected statewide NOx reductions used as the basis for Table 1 targets. Although PR 2306 also allows freight rail yard operators to elect to comply with alternative emission reductions targets; given the optional nature, it can be reasonably assumed that the alternative targets would not be elected if they are more costly to comply with. Therefore, this analysis focuses on analyzing the costs associated with PR 2306 Table 1 emission reductions targets.

Table 4-2 shows that the total NOx reductions within the South Coast AQMD jurisdiction that can be achieved by complying with PR 2306 Table 1 targets are generally less than one-third of total NOx reductions projected statewide from implementing the In-Use Locomotive Regulation. Therefore, even if the railroads (which are subject to PR 2306 emission reductions targets due to their role in operating the freight rail yards) choose to comply with PR 2306 solely with emission reductions from locomotives and not from other source categories, the total costs would still represent less than one-third of the statewide costs for them to comply with the In-Use Locomotive Regulation. If emission reductions are also achieved from other emission sources associated with freight rail yard operations (e.g., from drayage trucks due to ACF requirements on truck operators), the total costs directly incurred by the freight rail yard operators will be even lower.

According to CARB's Standardized Regulatory Impact Assessment for the In-Use Locomotive Regulation, the projected statewide costs, expressed in an average amortized annual total, represent "1.2 percent of [UP and BNSF railroads'] annual revenue" (p. 90). Moreover, the majority of the total projected statewide costs will come from the purchase costs of Tier 4 and cleaner locomotives which will result in direct NOx reductions, and these purchase costs were "determined through interviews with railroads and OEMs and corroborated using CARB incentive program data and industry feasibility studies" (p. 67).

**Table 4-2. South Coast AQMD Region’s Estimated Share of NOx Reductions Relative to the Statewide Total**

Calendar Year	Projected NOx Reductions from Freight Locomotives (tpd)*		Projected NOx Reductions from Drayage Trucks (tpd)*		South Coast Share from Freight Locomotive Reductions Statewide	South Coast Share from Drayage Truck Reductions Statewide
	Statewide	South Coast	Statewide	South Coast		
2027	6.16	0.26	1.84	1.59	4.2%	86.5%
2028	9.18	0.40	2.78	2.34	4.4%	84.1%
2029	12.24	0.97	2.89	2.46	7.9%	85.1%
2030	47.87	8.74	3.15	2.70	18.3%	85.5%
2031	51.88	9.46	3.37	2.87	18.2%	85.0%
2032	51.99	9.37	3.52	2.97	18.0%	84.3%
2033	52.09	9.46	3.45	2.87	18.2%	83.3%
2034	50.76	9.26	3.41	2.80	18.2%	82.0%
2035	57.61	10.80	3.54	2.83	18.7%	80.0%
2036	58.35	11.21	3.32	2.64	19.2%	79.4%
2037	59.33	11.71	3.14	2.48	19.7%	78.9%
2038	56.63	11.29	2.98	2.33	19.9%	78.3%
2039	53.25	10.76	2.85	2.22	20.2%	77.8%
2040	50.51	10.32	2.75	2.13	20.4%	77.4%
2041	47.85	9.90	2.68	2.06	20.7%	76.8%
2042	44.95	9.42	2.62	2.00	20.9%	76.3%
2043	41.56	8.85	2.58	1.95	21.3%	75.6%
2044	38.16	8.26	2.54	1.91	21.6%	74.9%
2045	37.08	8.12	2.51	1.87	21.9%	74.2%
2046	36.01	7.96	2.49	1.83	22.1%	73.4%
2047	34.71	7.76	2.47	1.80	22.4%	72.6%
2048	34.03	7.72	2.46	1.76	22.7%	71.9%
2049	33.52	7.72	2.45	1.75	23.0%	71.2%
2050	33.04	7.74	2.40	1.70	23.4%	70.9%

\* Rounded to the second decimal place

Overall, the scaling-based approach used in this cost analysis estimates the proportional share of net costs for the South Coast AQMD regional economy, considering the costs that will be incurred by railroads, as well as drayage truck operators, from complying with the state regulations for locomotives and drayage trucks. It is applied to the relevant cost categories identified in the CARB analyses. These categories are capital, operations, maintenance, and on-site infrastructure costs/cost savings for both locomotives and drayage trucks, as well as salvage and resale revenue cost savings for locomotives and midlife cost savings for drayage trucks. California’s Low Carbon Fuel Standard (LCFS) revenue for drayage trucks is also included since these revenues partially offset the costs of compliance for regulated entities, though such revenues represent a net-zero transfer rather than an economy-wide cost savings. Cost categories from the CARB analyses that

are excluded from this analysis include estimated impacts on taxes, insurance, and opportunity costs associated with the spending account feature of the In-Use Locomotive Regulation. Taxes and insurance are both transfers, and the spending account is not an element of PR 2306.

While on-site charging and refueling infrastructure costs from CARB are included as a cost category in this proportional analysis, PR 2306 does not compel freight rail yard owners and operators to invest in on-site or off-site infrastructure; rather, PR 2306 requires informational reporting on zero emission infrastructure planning and development, and the utilization of any such infrastructure that is installed and operative. CARB assumes on-site infrastructure costs are a relevant component of the regulated equipment technology upgrades and includes such costs in its cost estimates for In-Use Locomotive and ACF regulatory analyses. Assuming the implementation of PR 2306 will represent compliance with both state regulations proportionately within the South Coast AQMD region, the costs associated with on-site charging and refueling infrastructure are also included in the estimation of proportional costs in this analysis.

The statewide compliance costs estimated by CARB for In-Use Locomotive and ACF regulations reflect the full range of locomotives and trucks affected by these rulemakings, some of which are not relevant to freight rail yards (such as passenger locomotives or trucks not used for drayage activities). The scaling-based approach applied in the present analysis assumes that the costs per ton of NO<sub>x</sub> reduced for the locomotives and trucks regulated by the CARB statewide regulations are applicable to the equipment categories within the scope of PR 2306. Due to the similarities in equipment across different applications (e.g., the same trucks can be used for drayage and other freight transportation services), this approach is reasonable for estimating the portion of statewide costs associated with the South Coast AQMD region.

As additional context for the scaling approach applied here, unit cost inputs used by CARB for its state-level analyses for the In-Use Locomotive and ACF (drayage trucks) rulemakings are presented in Tables 4-3 through 4-5.<sup>47</sup> CARB uses these inputs, as well as detailed information on current fleet inventories and operations, to estimate compliance costs associated with implementation of the state regulations. CARB also makes assumptions regarding the technologies that will replace existing vehicles, based on the equipment duty cycle. For locomotives, line haul freight (and passenger) locomotives are assumed to be replaced with zero emission hydrogen fuel cell locomotives, while switch locomotives are assumed to be replaced with battery electric locomotives.<sup>48</sup> For drayage trucks, CARB assumes a mix of battery electric and fuel cell vehicles, adopting an assumption that all drayage trucks are Class 8 day cabs.

---

<sup>47</sup> The economic analyses for the In-Use Locomotive and ACF rulemakings do not present estimates of the annual operations cost per equipment type, though they do present their assumptions regarding the future prices of diesel, electricity, and hydrogen. Table 4-3 presents these price projections.

<sup>48</sup> CARB In-Use Locomotive SRIA, p. 67.

**Table 4-3. Unit Capital Costs for Locomotive and Drayage Trucks Used in CARB Analyses (2023\$ per Unit of Equipment)**

Equipment Type	Technology/Fuel Type		
	Electric	Hydrogen	Diesel
<i>Locomotives:</i>			
Line Haul Locomotives	\$7,347,572 <sup>2</sup>	\$6,171,960 <sup>1</sup>	\$3,644,396 <sup>1</sup>
Road Switch Locomotives	\$3,997,079 <sup>1</sup>	\$3,850,128 <sup>2</sup>	\$3,174,151 <sup>1</sup>
Yard Switch Locomotives	\$3,644,396 <sup>1</sup>	\$3,850,128 <sup>2</sup>	\$2,539,321 <sup>1</sup>
<i>Drayage Trucks:</i>			
Class 8 Day Cab Tractors	\$182,623 <sup>3</sup>	\$193,322 <sup>3</sup>	\$168,760 <sup>3</sup>

Note:			
<p>In addition to routine annual maintenance, locomotives and drayage trucks also undergo midlife/overhaul maintenance. This includes engine rebuilds for diesel equipment, battery replacements for electric equipment, and fuel cell stack refurbishments for hydrogen equipment. The frequency of midlife/overhaul activities depends on the equipment and technology type (e.g., line haul locomotives require overhaul every 6 years while switch locomotives require overhaul every 14 years). For line haul locomotives, a single overhaul can range from approximately \$58,000 (diesel) to \$60,000 (hydrogen) in 2023\$. Overhaul costs are lower for switch locomotives, ranging from approximately \$12,000 (diesel) to \$21,000 (electric). For drayage trucks, CARB does not present specific costs for midlife activities but does provide guidance on their calculations (e.g., the cost of a fuel cell stack refurbishment is approximately one third the cost of a new fuel cell stack).</p>			

**Table 4-5. Electricity, Hydrogen, and Diesel Price Projections from CARB’s In-Use Locomotive Analysis (Operating Costs, 2023\$ per Diesel Gallon Equivalent)**

Year	Electricity (DGE) <sup>1</sup>	Hydrogen (DGE) <sup>1</sup>	Diesel (DGE) <sup>1</sup>
2025	\$8.71	\$20.68	\$4.76
2030	\$9.58	\$16.48	\$4.95
2050	\$9.14	\$6.53	\$5.57

<sup>1</sup> California Air Resources Board. (2022). Proposed In-Use Locomotive Regulation Standardized Regulatory Impact Assessment (SRIA). pp. 75-76. Available at: <https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2022/locomotive22/appb.pdf>

Note: For comparison across fuel types, the prices for electricity and hydrogen are converted from kilowatt-hour (kWh) and kilogram (kg) to diesel gallon equivalents (DGE) using conversion factors of 37.0 kWh per DGE and 1.11 kg per DGE derived from U.S. DOE’s Alternative Fuels Data Center (Available at: <https://afdc.energy.gov/fuels/properties?fuels=HY,ELEC>). CARB’s Advanced Clean Fleets analysis also provides fuel economy estimates for drayage trucks. Applying the same conversion factors, electric drayage trucks are estimated to get 22.2 miles/DGE, hydrogen drayage trucks are estimated to get 12.9 miles/DGE, and diesel drayage trucks are estimated to get 7 miles/DGE. Equivalent information is not provided for locomotives.

The combined implementation of PR 2306 with statewide regulations will result in new demand for alternative fuels within the Basin, namely electricity and hydrogen. The existing utility supply and distribution systems may require capacity upgrades to accommodate this new demand. Such improvements would represent off-site infrastructure improvements, such as grid upgrades that may include electricity generation resources, transmission capacity, and distribution system capacity (e.g., additional substations and/or circuits), as well as hydrogen fuel production, storage, and distribution systems. CARB does not consider off-site infrastructure improvements in its analysis of costs for the In-Use Locomotive and ACF rulemakings. While off-site infrastructure upgrades may be necessary to support vehicle technology changes, many of these investments are required under the baseline pursuant to separate California regulations, as noted by CARB.<sup>49, 50</sup> Clearly assigning system-wide improvements to specific rules is difficult, due to the overlapping nature of concurrent efforts, as well as the shared nature of the energy supply grid across many user groups.<sup>51,52,53</sup> Accordingly, the only infrastructure costs quantified in this proportional

<sup>49</sup> See discussion of SB 350 and other utility actions on page 52 of CARB’s In-Use Locomotive SRIA.

<sup>50</sup> CARB provides cost estimates for some off-site infrastructure improvements in its SB 671 Clean Freight Corridor Efficiency Assessment: [Senate Bill 671 Clean Freight Corridor Efficiency Assessment | California Transportation Commission](#)

<sup>51</sup> “2035 Report 2.0: Distribution Grid Cost Impacts Driven by Transportation Electrification,” (2021). Energy + Environmental Economics.

<sup>52</sup> “2035 Report 2.0: Transportation.” 2021. Goldman School of Public Policy, University of California Berkeley.

<sup>53</sup> “Electric Vehicles at Scale – Phase II: Distribution System Analysis” (2022). Pacific Northwest National Laboratory

analysis are the share of CARB’s statewide estimates for on-site infrastructure costs relevant to PR 2306.

### Estimated Costs for Proportional Implementation of Statewide Regulations

As shown in Table 4-6, the South Coast AQMD region-specific portion of statewide costs across all years analyzed (2027-2050) is approximately \$2.27 billion in undiscounted 2023 dollars.<sup>54</sup> This is comprised of \$2.87 billion associated with locomotives and -\$596 million (i.e., a \$596 million savings) related to drayage trucks, inclusive of fuel cost-savings and LCFS credits as discussed above.<sup>55</sup> As a share of statewide In-Use Locomotive and ACF regulations compliance costs for the same timeframe and cost categories used in this analysis, the scaled cost estimates for the South Coast AQMD region are 18.4% for locomotives and 4.0% for drayage trucks. Note that these are not incremental costs resulting from the implementation of PR 2306, but rather the share of costs expected to accrue in the South Coast AQMD jurisdiction as a result of the combined implementation of PR 2306 with statewide regulations. The incremental costs attributable solely to PR 2306 are expected to be nominal and are discussed later in this section.

**Table 4-6. Total Present Value and Annualized Compliance Costs Over the 2027-2050 Period (2023\$)**

	Present Value Cost	Annualized Cost
<b>Undiscounted</b>	\$2,270,000,000	\$94,600,000
<b>1% Discount Rate/Real Interest Rate</b>	\$2,040,000,000	\$95,200,000
<b>4% Discount Rate/Real Interest Rate</b>	\$1,620,000,000	\$102,000,000

Tables 4-7 and 4-8 present the distribution of undiscounted statewide compliance costs apportioned to the South Coast AQMD region across the various cost categories, for locomotives and drayage trucks respectively. For locomotives, the most significant costs are for the capital (procuring new locomotives) and operating (changes in fuel costs) categories, while new maintenance and infrastructure costs represent a smaller contribution to costs. Increased salvage and resale revenues represent a small cost-savings. For drayage trucks, new investments in infrastructure represent the largest single cost, while additional capital and midlife costs present a smaller cost contribution. These new costs are nearly entirely offset by new operating (fuel) and maintenance cost-savings. When revenue under LCSF is included, total costs become negative, or cost-savings.

<sup>54</sup> All statewide costs from CARB’s In-Use Locomotive and ACF regulations analyses were inflated to 2023 dollars (using the Bureau of Economic Analysis Implicit Price Deflator for Gross Domestic Product) before being scaled.

<sup>55</sup> While this cost analysis estimates costs and cost-savings incurred up to 2050, the 2022 AQMP cost-effectiveness analysis referenced in Box 4-1 included costs and cost-savings up to 2037, therefore with a shorter time period for net operating and maintenance cost-savings as well as LCFS revenue to accrue.

**Table 4-7. Undiscounted Costs Attributable to Locomotives Over the 2027-2050 Period  
(2023\$)**

<b>Cost Category</b>	<b>Cost</b>
Capital Cost	\$1,900,000,000
Infrastructure Cost	\$145,000,000
Operating Cost	\$699,000,000
Maintenance Cost	\$189,000,000
Salvage Revenue	-\$6,520,000
Resale Revenue	-\$61,300,000
<b>Total</b>	<b>\$2,870,000,000</b>
Note: Totals may not sum due to rounding.	

**Table 4-8. Undiscounted Costs Attributable to Drayage Trucks Over the 2027-2050 Period  
(2023\$)**

<b>Cost Category</b>	<b>Cost</b>
Capital Cost	\$495,000,000
Infrastructure Cost	\$1,980,000,000
Operating Cost	-\$1,550,000,000
Maintenance Cost	-\$851,000,000
Midlife Costs	\$42,000,000
<b>Total Without LCFS Revenues</b>	<b>\$119,000,000</b>
LCFS Revenue	-\$715,000,000
<b>Total With LCFS Revenues</b>	<b>-\$596,000,000</b>
Note: Totals presented without and with LSFS revenues because these revenues represent a transfer. Totals may not sum due to rounding.	

As mentioned earlier, the emission reductions targets in PR 2306 are set levels equivalent to achieving emission reductions within South Coast AQMD from proportional implementation of state regulations addressing emissions from locomotives and trucks. However, emission reductions related to TRUs, CHE, and OSE may be used to contribute to a freight rail yard's compliance with PR 2306. For context, Tables 4-9 and 4-10 include information on unit costs applicable to these additional equipment categories, for both zero emission electric and conventional diesel options.

**Table 4-9. Unit Capital Costs for CHE and TRU (2023\$ per Unit of Equipment)**

This analysis estimates the proportional share of statewide compliance costs based on the scenario of proportional implementation within South Coast AQMD. To provide further context on potential costs associated with systematic infrastructure development beyond on-site installation, prior reports have also addressed zero emission technology implementation and the potential associated costs, both nationally and in California. For example, the 2022 Port of Long Beach Port Master Plan provides information on the Port's goals for transitioning to cleaner operations,

including through the use of zero emission technology.<sup>56</sup> The 2023 Zero Emission Planning and Grid Assessment for the Port of Los Angeles assesses the feasibility of electrifying CHE and provides an economic analysis of different electrification scenarios.<sup>57</sup> With regard to drayage trucks, a 2024 study performed by Roland Berger entitled “Forecasting a Realistic Electricity Infrastructure Buildout for Medium- & Heavy-Duty Battery Electric Vehicles” estimates that electrifying all medium- and heavy-duty vehicles across the United States would require \$622 billion of investment in chargers, site infrastructure, and utility service costs.<sup>58</sup> The study also estimates that California would need to invest over \$25 billion for distribution grid upgrades alone.<sup>59</sup> However, as mentioned earlier, it is challenging to quantify and assign systemic infrastructure costs to regulatory actions, requirements, and other initiatives introduced concurrently by multiple entities.

### ***HEALTH BENEFITS***

The Basin is home to roughly two-thirds of California’s EJ communities.<sup>60</sup> The combined implementation of statewide regulations and PR 2306 would ensure that the public health benefits sought from statewide regulations accrue within South Coast AQMD and to the EJ communities which are disproportionately impacted by pollution. This health benefits analysis relies upon a streamlined approach to estimate human health benefits of the combined implementation of PR 2306, CARB’s In-Use Locomotive Regulation, and CARB’s ACF Regulation using estimates of incidence-per-ton (IPT) and benefits-per-ton (BPT) of emissions reduced derived from the health benefits assessment in the 2022 AQMP Final Socioeconomic Report.<sup>61</sup> The IPT and BPT method provides robust, reasonable estimates of the magnitude of health benefits and is consistent with previously employed approaches by South Coast AQMD, as well as by U.S. EPA and CARB.<sup>62,63,64</sup> The 2022 AQMP Socioeconomic Impact Report estimates health benefits in 2032 and 2037 based on: 1) modeled concentrations of ambient ozone and PM2.5 reductions at a 4-km grid scale across the Basin; and 2) the U.S. EPA’s Environmental Benefits Mapping and Analysis

Program – Community Edition (BenMAP-CE) model. The 2022 AQMP benefits result mostly from projected reductions of NO<sub>x</sub> under the ozone control measures as NO<sub>x</sub> is the key pollutant for the region’s ozone attainment challenges. This analysis utilizes the projected 2022 AQMP emissions reductions and associated health benefits to generate average IPT and BPT estimates. These estimated IPT and BPT factors were then used to generate estimates of the quantity and monetized value of health benefits resulting from anticipated emission reductions from PR 2306, in conjunction with state regulations.

#### **Box 4-2. Consequences of NAAQS Nonattainment**

The federal Clean Air Act (CAA) requires submission of a SIP for nonattainment areas that do not meet the federal NAAQS. South Coast AQMD is in extreme nonattainment for ozone and serious nonattainment for PM<sub>2.5</sub>. The ozone control measures in the 2016 AQMP were approved by the U.S. EPA for inclusion in the California SIP and included a suite of facility-based mobile source measures mainly to reduce mobile source emissions from freight transportation. PR 2306 will implement the federally approved SIP measure to address freight emissions associated with rail yards.

Severe consequences can result from nonattainment of NAAQS, particularly the continued harm to public health and EJ communities. Failures in CAA planning requirements can also trigger federal sanctions and introduce economic uncertainties for the region. The first sanction will increase the air permitting offset ratio from the current ratio of 1.2-to-1 to a ratio of 2-to-1, which is expected to make air permitting substantially more difficult in our region. The second sanction is loss of federal highway funding, potentially to the magnitude of \$35.7 billion by 2045.<sup>a</sup>

Additionally, CAA Section 185 requires major stationary sources of NO<sub>x</sub> and/or volatile organic compounds (both ozone precursors) that are located in extreme or severe ozone nonattainment areas to either reduce their emissions by 20 percent from a baseline amount or pay a nonattainment fee. The annual average cost of complying with nonattainment fee requirements is estimated at an undiscounted total of more than \$250 million between 2025 and 2035, affecting over 300 facilities across many industries in our region.<sup>b</sup> Given that 80 percent of the region’s NO<sub>x</sub> emissions come from mobile sources, the costs of nonattainment fees will most likely continue to accrue if significant emission reductions from mobile sources do not occur to help bring the region into attainment.

Michael S. Regan ([https://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/2-23cv02646\\_docketentry\\_04-07-2023\\_1.pdf](https://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/2-23cv02646_docketentry_04-07-2023_1.pdf)).

<sup>b</sup> Final Socioeconomic Impact Assessment for Proposed Rule 317.1 – Clean Air Act Nonattainment Fees for 8-Hour Ozone Standards: <http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2024/2024-jun7-024.pdf>.

IPT and BPT estimates for both PM<sub>2.5</sub>-specific and ozone-specific benefits are developed by dividing the 2022 AQMP health benefits results by the total AQMP emissions reductions of NO<sub>x</sub>, a key PM<sub>2.5</sub> and ozone precursor. The PM<sub>2.5</sub>-related health benefits associated with the 2022 AQMP reflect reductions in NO<sub>x</sub> and, to a lesser degree, directly emitted fine particles (see Table 3-1 in the 2022 AQMP Socioeconomic Report). For this analysis, all PM<sub>2.5</sub>-related benefits from the 2022 AQMP are attributed to reductions in NO<sub>x</sub> as NO<sub>x</sub> reductions are the primary driver of PM<sub>2.5</sub> reductions in the 2022 AQMP.

The IPT and BPT factors generated from the 2022 AQMP are applicable to the emissions reductions anticipated from PR 2306 in conjunction with the state regulations, which affect mobile sources at rail yard operations, since a majority (85%) of the 2022 AQMP NO<sub>x</sub> emissions reductions are attributed to on-road and off-road mobile sources. As such, the 2022 AQMP IPT

and BPT factors are representative of the anticipated health benefits associated with NOx reductions from PR 2306 and statewide regulations.

This reduced-form approach relies upon an estimate of the average health impact for each ton of pollutant emissions (and/or its precursors) reduced. This average estimate is based on the benefits derived from the 2022 AQMP air quality modeling, which accounts for potential nonlinearities between NOx emissions and ozone concentrations in the Basin. Thus, although a variable marginal impact of emissions on benefits is not employed, the average IPT and BPT of the 2022 AQMP implementation implicitly reflects the impacts of nonlinear air quality chemistry on the overall expected health benefits. Additional methodological assumptions include:

- Changes in incidence are proportional to ambient PM2.5 or ozone concentrations.
- Changes in primary pollutant concentrations are proportional to changes in directly emitted NOx.
- The IPT and BPT values are specific to the year (2032 and 2037) being evaluated.
- For years prior to 2032, IPT and BPT values are not calculated. Instead, health benefits grow linearly from zero benefits in 2026 to the estimated 2032 total benefits (based upon 2032 IPT and BPT values).
- For intermediate years between 2032 and 2037, IPT and BPT values grow linearly.
- For years beyond 2037, 2037 IPT and BPT values are projected through 2050 based on either future population growth (IPT and cost-of-illness based BPT estimates), or both future population growth and income growth (willingness-to-pay based BPT estimates).

This analysis assesses public health benefits for which epidemiological studies have demonstrated an association between increases in ambient air pollution exposure and increases in illness and other health effects (morbidity endpoints) or increases in death rates from various causes (mortality endpoints) (U.S. EPA, 2019; U.S. EPA, 2020). The health endpoints quantified in this report are the same health endpoints quantified in the 2022 AQMP Socioeconomic Report. Additional details concerning the selection of quantified health effects and the generation of health benefits results are available in Chapter 3 and Appendices 3-A and 3-B of the 2022 AQMP Final Socioeconomic Report.<sup>65</sup>

Average NOx reductions in South Coast AQMD projected from the combined implementation of PR 2306 and statewide regulations are summarized in Table 4-11. PR 2306 is projected to reduce NOx emissions by an average of 10.5 tpd over the 2027 – 2050 period.

---

<sup>65</sup> South Coast AQMD. 2022 Final Socioeconomic Report – Appendices: <http://www.aqmd.gov/docs/default-source/clean-air-plans/socioeconomic-analysis/final/aqmp-2022-socioeconomic-report-appendices-final.pdf>

**Table 4-11. Projected NOx Emission Reductions (tpd)**

	<b>Annual Average (2027 – 2050)</b>
Baseline Emissions	16.5
Controlled Emissions under PR 2306 and State Rules	6.0
Emission Reductions	<b>10.5</b>

The estimated IPT factors were used in conjunction with projected annual emission reductions to estimate the health benefits presented in Table 4-12 for each health endpoint by pollutant. In total, it is estimated that 7,000 premature deaths will be avoided from 2027 through 2050 due to improved air quality, and that the number of hospital admissions from all endpoints considered (asthma, cardiovascular, respiratory, Alzheimer’s disease, Parkinson’s disease, and ischemic stroke) would decrease by about 1,766 per year. Many EJ communities are located near the sources of pollution addressed by PR 2306 and statewide regulations and will realize a substantial portion of these estimated health benefits as a result.

Table 4-12. Health Effect Estimates\*

Health Effect	Annual Average 2027-2050	Total 2027-2050
<b>Premature Deaths Avoided, All Cause</b>		
Long-Term Ozone Exposure <sup>1</sup>	69	1,600
Long-Term PM2.5 Exposure	230	5,400
<b>Reduced Morbidity Incidence</b>		
<i>Long-Term Ozone Exposure</i>		
Asthma, New Onset	890	21,000
<i>Short-Term Ozone Exposure<sup>1</sup></i>		
Asthma Symptoms (Chest Tightness, Cough, Shortness of Breath, and Wheeze)	160,000	3,900,000
Emergency Room Visits (ED), Asthma	59	1,400
ED Visits, All Respiratory Minus Asthma	140	3,300
Hospital Admissions (HA), Asthma	1,700	40,000
Minor Restricted Activity Days	65,000	1,600,000
School Loss Days, All Cause	19,000	460,000
<i>Long-Term PM2.5 Exposure</i>		
Asthma, New Onset	330	7,900
HA, Alzheimer's Disease	23	560
HA, Parkinson's Disease	9.7	230
Incidence, Hay Fever/Rhinitis	1,600	38,000
Incidence, Lung Cancer (non-fatal)	19	450
<i>Short-Term PM2.5 Exposure</i>		
Acute Myocardial Infarction, Nonfatal	3.4	81
Asthma Symptoms, Albuterol use	55,000	1,300,000
ED Visits, Asthma	12	280
ED Visits, All Cardiac Outcomes	25	600
ED Visits, All Respiratory Minus Asthma	57	1,400
Emergency Hospitalizations (EHA), Asthma	0.6	14
HA, All Cardiac Outcomes	8.5	200
HA, All Respiratory	24	570
Incidence, Ischemic Stroke	13	320
Incidence, Out-of-Hospital Cardiac Arrest	2.2	54
Minor Restricted Activity Days <sup>2</sup>	75,000	1,800,000
Work Loss Days <sup>2</sup>	13,000	310,000

\* Each health effect represents the point estimate of a statistical distribution of potential outcomes (rounded to two significant figures).

<sup>1</sup> Health effects of ozone exposure are quantified for the summer planning period only (i.e., May 1 to September 30). There are potentially more premature mortalities and morbidity conditions avoided outside the ozone peak season.

<sup>2</sup> Expressed in person-days. Minor Restricted Activity Days (MRAD) refer to days when some normal activities are avoided due to illness.

Table 4-13 presents the quantifiable and monetized value of public health benefits, which are estimated to be \$5 billion annually on average. About 97 percent of these benefits are attributable to avoided premature mortalities. In contrast, the proportional implementation of state regulations required by PAR 2306 is estimated to cost \$102 million annually as reported in Table 4-6, or roughly two percent of the annual monetized health benefits. The estimates are based on a value of statistical life (VSL) of \$12.4 million<sup>66</sup> and the assumption that the willingness-to-pay (WTP) for mortality risk reductions will increase as per-capita income grows; specifically, a one percent increase in income was assumed to raise VSL by 1.1 percent (i.e., an income elasticity of 1.1).<sup>67</sup> These values correspond to a present value of quantified benefits of \$65 billion at a four percent discount rate, or \$100 billion at a one percent discount rate, cumulatively from 2027-2050. The values in Table 4-13 are presented in 2023 U.S. dollars and reflect projected income levels.

**Table 4-13. Monetized Public Health Benefits (Billions of 2023 Dollars)<sup>1,2</sup>**

	<b>Total (2027-2050)</b>	<b>Annual Average (2027-2050)</b>	<b>Present Value<sup>3</sup> (2027-2050)</b>
<b>Mortality-related benefits</b>	<b>\$117</b>	<b>\$4.9</b>	<b>\$63</b>
<i>Long-Term Ozone Exposure</i>	\$27	\$1.1	\$15
<i>Long-Term PM2.5 Exposure</i>	\$89	\$3.7	\$48
<b>Morbidity-related benefits</b>	<b>\$3.6</b>	<b>\$0.15</b>	<b>\$2.0</b>
<b>Grand Total</b>	<b>\$120</b>	<b>\$5.0</b>	<b>\$65</b>

Note:

- 1) Numbers may not sum due to rounding (rounded to two significant figures).
- 2) The monetized public health benefits reported in this table were estimated for the four-county region, which includes areas that are located outside the Basin. However, staff estimated that mortality-related benefits accrued to the areas within the Basin would account for 99 percent of the total. In other words, the difference is minimal between quantifying public health benefits for the Basin and for the four-county region.
- 3) Present Value is discounted to year 2024 using a 4% Discount Rate.

### ***SOCIOECONOMIC IMPACT ASSESSMENT***

On March 17, 1989, the South Coast AQMD Governing Board adopted a resolution which requires an analysis of the economic impacts associated with adopting and amending rules and regulations. In addition, Health and Safety Code Sections 40440.8 and 40728.5 require a socioeconomic impact assessment for proposed and amended rules resulting in significant impacts to air quality or emission limitations. Thus, this Socioeconomic Impact Assessment has been prepared in accordance with Health and Safety Code and the South Coast AQMD Governing Board

<sup>66</sup> All VSL values presented here are in 2023 dollars and 2013 income levels, health benefits results estimated from the VSL and converted into IPT and BPT values for this analysis were converted to 2032 and 2037 income levels using published CA Wages & Salaries for consistency with the 2022 AQMP Final Socioeconomic Report.

<sup>67</sup> Industrial Economics and Lisa Robinson. Review of Mortality Risk Reduction Valuation Estimates for 2016 Socioeconomic Assessment: [https://www.aqmd.gov/docs/default-source/clean-air-plans/socioeconomic-analysis/iecmemos\\_november2016/scmortalityvaluation\\_112816.pdf](https://www.aqmd.gov/docs/default-source/clean-air-plans/socioeconomic-analysis/iecmemos_november2016/scmortalityvaluation_112816.pdf)

requirements. The industries and businesses affected, potential costs of proportional implementation of state regulations in South Coast AQMD, and anticipated public health benefits are discussed in the previous sections of this chapter, while the impacts on small businesses, range of probable costs attributable specifically to PR 2306, and macroeconomic impacts are discussed in the following.

### **Small Business Analysis**

The South Coast AQMD defines a “small business” in Rule 102 – Definition of Terms for purposes of fees as one which employs 10 or fewer persons and which earns less than \$500,000 in gross annual receipts. The South Coast AQMD also defines “small business” for the purpose of qualifying for access to services from the South Coast AQMD’s Small Business Assistance Office (SBAO) as a business with an annual receipt of \$5 million or less, or with 100 or fewer employees. In addition to the South Coast AQMD’s definitions of a small business, the federal Small Business Administration (SBA) and the federal 1990 Clean Air Act Amendments (1990 CAAA) also provide definitions of a small business.

The 1990 CAAA classifies a business as a “small business stationary source” if it: 1) employs 100 or fewer employees; 2) does not emit more than 10 tons per year of either VOC or NO<sub>x</sub>; and 3) is a small business as defined by SBA. The SBA definitions of small businesses have revenue or employee count thresholds that may vary according to designated six-digit NAICS codes. For example, for the industry of Line-haul Railroads (NAICS 482111), the threshold for a small business is 1,500 employees.

None of the affected facilities listed in Table 4-1 would qualify as small businesses under the various definitions used by South Coast AQMD. Both UP and BNSF earned over \$20 billion in revenue and employed more than 30,000 people in 2023, according to publicly available securities filings, and government entities would not be considered small businesses.

### ***PR 2306 Compliance Costs***

PR 2306 includes reporting and notification requirements which will impose nominal incremental costs relative to CARB’s statewide regulations. Table 4-14 outlines the expected labor hours and costs to produce the reports required by PR 2306 assuming that regulated entities will contract for the development of the reports at a rate of \$150 per hour.

**Table 4-14. Reporting Costs Associated with PR 2306 (2023\$)**

Reporting Item	Frequency	Labor Hours Per Item	Total Cost Per Item	Total Cost Per Facility, 2027-2050
Initial Facility Information Report	One-time	30	\$4,500	\$4,500
Initial Zero Emission Infrastructure Report	One-time	20	\$3,000	\$3,000
Milestone Compliance Report	Every three years	200	\$30,000	\$240,000
Zero Emission Infrastructure Status Update Report	Every three years	15	\$2,250	\$18,000
Various Notifications	Triggered by specific events	1	\$150	N/A
Note: The number of notifications triggered by specific events is unforecastable, so the total costs from 2027-2050 are not estimated.				

As shown in Table 4-15, the total reporting costs associated with PR 2306 across all years analyzed (2027-2050) are approximately \$6,637,500 in undiscounted 2023 dollars. On an annual basis, these reporting costs are approximately \$255,290 in undiscounted 2023 dollars. Discounted reporting costs are presented in Table 4-15 as well.

**Table 4-15. Reporting Costs Associated with PR 2306: Total Present Value and Annualized Reporting Costs Over the 2027-2050 Period For All Facilities (2023\$)**

	Present Value Cost	Average Annual Cost
<b>Undiscounted</b>	\$6,637,500	\$255,290
<b>1% Discount Rate/Real Interest Rate</b>	\$5,778,470	\$259,640
<b>4% Discount Rate/Real Interest Rate</b>	\$3,953,230	\$272,880

### *PR 316.2 Compliance Costs*

PR 316.2 establishes the administrative fees to be paid by freight rail yard owners or operators subject to PR 2306 to recover reasonable costs incurred by South Coast AQMD for implementation of PR 2306. Estimates indicate that there are 25 freight rail yards expected to initially submit Initial Facility Information Reports and Initial Zero Emission Infrastructure Reports pursuant to the schedule specified in PR 2306. Additionally, the aforementioned freight rail yards are also required to submit Milestone Compliance Reports and Zero Emission Infrastructure Update Reports consistent with PR 2306 milestone years.

Staff expect to receive 25 Initial Facility Information Reports and 25 Initial Zero Emission Infrastructure Reports for review and approval following the initial base period. Additionally, staff expect to receive 25 Milestone Compliance Reports and 25 Zero Emission Infrastructure Status Update Reports for each milestone year subsequent to the base period. Additional notification requirements in PR 2306 include Change of Freight Rail Yard Owner/Operator, Freight Rail Yard Shutdown, Exceedance of Low Activity Exemption Threshold, and Proposed Freight Rail Yard Construction, Conversion, or Expansion. It is speculative to predict the total number of new

facilities which could potentially be subject to PR 2306 in the future; however, that does not preclude additional facilities from becoming subject to PR 2306 after the rule’s potential adoption.

The total cost for South Coast AQMD to administer and enforce the reporting and notifications associated with PR 2306 was determined as a function of the burdened hourly rates for staff multiplied by the total staff time required to process each type of reports and notifications required by PR 2306. The burdened hourly rate includes salary and benefits for that position, plus a proportionate share (based on an allocation per FTE) of South Coast AQMD operational expenses such as costs for the building, utilities, insurance, etc. Staff time associated with reviewing submitted notifications and reports are based on past experiences with similar reporting audits conducted for existing rules and regulations with similar scale for stationary sources, such as those included in Rule 1109.1 (Petroleum Refineries and Related Operations), as well as indirect sources, such as those included in Rule 2305 (WAIRE Program).<sup>68</sup>

Table 4-16. 4-16 shows the estimated average time required by staff to review each report as well as associated burdened rates for each position and total costs for each report. Evaluation of review times for reports are based on estimated hours South Coast AQMD staff will need to audit the reports filed and perform investigations and inspections as needed to verify the accuracy and completeness of these reports. Staff will need to verify an affected freight rail yard continuous compliance with the applicable requirements in PR 2306 and initiate enforcement action(s) upon freight rail yard’s failure to demonstrate or maintain compliance with the provisions of PR 2306.

**Table 4-16. Fees and Review Time Estimates for PR 316.2 Reports**

Staff	Burdened Hourly Rate	Initial Facility Information Report	Initial Zero Emission Infrastructure Report	Milestone Compliance Report	Zero Emission Infrastructure Status Update Report
Planning & Rules Manager	\$149.71	1.0 hrs	0.5 hrs	6.0 hrs	0.5 hrs
Program Supervisor	\$135.56	6.0 hrs	1.0 hrs	20.0 hrs	1.0 hrs
Air Quality Specialist	\$118.42	12.0 hrs	2.5 hrs	60.0 hrs	2.5 hrs
Air Quality Inspector II	\$101.36	10.0 hrs	10.0 hrs	10.0 hrs	10.0 hrs
<b>Total Cost per Report*</b>		<b>\$3,397.71</b>	<b>\$1,520.07</b>	<b>\$11,728.26</b>	<b>\$1,520.07</b>

\* Similar to other South Coast AQMD fees in Regulation III, costs are expected to increase over time, adjusted for increased staff costs and overhead costs due to inflation. All fees in PR 316 will therefore be adjusted periodically consistent with all other Regulation III fees pursuant to Rule 320.

<sup>68</sup> Supplemental Information for PR 316.2 Fee Rates can be found on <https://www.aqmd.gov/home/rules-compliance/rules/scaqmd-rule-book/proposed-rules/rule-2306>

Table 4-17 shows the estimated average time required by staff to review each notification as well as associated burdened rates for each position and total costs for each notification. Notifications associated with PR 2306 are expected to require less information and staff time compared to the required reports. Review times for notifications are based on estimated hours for staff to process notifications, update internal records of notified changes, and conduct any necessary inspections.

**Table 4-17. Fees and Review Time Estimates for PR 316.2 Notifications**

Staff	Burdened Hourly Rate	Change of Freight Rail Yard Operator		Change of Freight Rail Yard Owner		Freight Rail Yard Shutdown	Exceedance of Low Activity Exemption Threshold	Proposed Freight Rail Yard Construction, Conversion, or Expansion Notification
		Initial	Secondary	Initial	Secondary			
Planning & Rules Manager	\$149.71	0.15 hrs	0.10 hrs	0.15 hrs	0.10 hrs	0.25 hrs	0.25 hrs	0.25 hrs
Program Supervisor	\$135.56	0.15 hrs	0.10 hrs	0.15 hrs	0.10 hrs	0.25 hrs	0.25 hrs	0.25 hrs
Air Quality Specialist	\$118.42	0.30 hrs	0.20 hrs	0.30 hrs	0.20 hrs	0.50 hrs	0.50 hrs	0.50 hrs
<b>Total Staff Costs per Notification</b> <small>Error! Bookmark not defined.</small>		<b>\$78.32</b>	<b>\$52.21</b>	<b>\$78.32</b>	<b>\$52.21</b>	<b>\$130.53</b>	<b>\$130.53</b>	<b>\$130.53</b>

The average annual cost of reporting fees for all facilities affected by PR 316.2 is estimated to be \$106,640 over the forecast period. This Socioeconomic Impact Assessment does not estimate the total cost of fees for notifications, as they are likely to be infrequent and the timing of these events is unforecastable.

### Macroeconomic Impacts

South Coast AQMD typically uses the Regional Economic Models, Inc Policy Insight Plus (REMI PI+) model to estimate the impacts of proposed rules on the regional economy. However, when the estimated average annual cost of a proposed rule is less than one million current U.S. dollars, South Coast AQMD will not use the REMI model because the resulting impacts are expected to be minimal and the REMI job impact forecast becomes less precise as compliance costs decline. Implementation of PR 2306 is expected to result in annual average costs of \$255,290 for reporting and \$106,640 for fees associated with PR 316.2. As a result, this Socioeconomic Impact Assessment does not utilize the REMI model to estimate macroeconomic impacts.

For informational purposes, this section instead presents an assessment of the macroeconomic impacts in the South Coast AQMD jurisdiction based on CARB's In-Use Locomotive Regulation. This Socioeconomic Impact Assessment relies on the assumption that the local share of statewide job impacts presented in the Standardized Regulatory Impact Assessment (SRIA) of the In-Use Locomotive Regulation is proportional to the share of locomotive emissions reductions in the

South Coast AQMD jurisdiction presented in Table 4-2.<sup>69</sup> Note that the estimated job impacts represent the share of statewide job impacts resulting from the In-Use Locomotive Regulation that are likely to accrue in South Coast AQMD region, rather than incremental job impacts resulting from the implementation of PR 2306. Table 4-18 displays the statewide job impacts estimated by CARB in selected years resulting from the In-Use Locomotive Regulation and the estimated share of job impacts expected to accrue in the South Coast AQMD jurisdiction. A similar analysis based on CARB’s ACF regulation is not included, as the ACF regulation also impacts drayage operations at seaports, state and local government fleet vehicles, and other vehicles which are outside the scope of PR 2306.

**Table 4-18. South Coast AQMD-specific Share of Statewide In-Use Locomotive Job Impacts**

<b>In-Use Locomotive Regulation</b>	<b>2030</b>	<b>2035</b>	<b>2040</b>	<b>2045</b>	<b>2050</b>
Statewide Change in Jobs	-6,991	-13,101	-14,543	-7,509	-3,760
Share in South Coast AQMD	18.3%	18.7%	20.4%	21.9%	23.4%
<b>Local Change in Jobs Relative to Baseline</b>	-1,279	-2,450	-2,967	-1,644	-880

#### ***CALIFORNIA ENVIRONMENTAL QUALITY ACT***

Pursuant to the California Environmental Quality Act (CEQA), PR 2306 is a later activity within the scope of the programs approved earlier in the 2022 Air Quality Management Plan (AQMP) and 2016 AQMP per CEQA Guidelines Section 15168(c)(2), and the Final Program Environmental Impact Report (EIR) for the 2022 AQMP and the Final Program EIR for the 2016 AQMP adequately describe the activities associated with implementing PR 2306 such that no new environmental document will be required. The analysis supporting this conclusion is provided in Appendix A of this Staff Report, which was released for public review and comment at least 30 days prior to the South Coast AQMD Governing Board Hearing for PR 2306 and PR 316.2, which is anticipated to be heard on August 2, 2024 (subject to change).

In addition, pursuant to CEQA Guidelines Sections 15002(k) and 15061, PR 316.2 involves charges by public agencies for the purpose of meeting operating expenses which are statutorily exempt from CEQA pursuant to CEQA Guidelines Section 15273. A Notice of Exemption will be prepared for PR 316.2 pursuant to CEQA Guidelines Section 15062, and if approved, the Notice of Exemption will be filed for posting with the State Clearinghouse of the Governor’s Office of Planning and Research, and with the county clerks of Los Angeles, Orange, Riverside and San Bernardino counties.

#### ***DRAFT FINDINGS UNDER HEALTH AND SAFETY CODE SECTION 40727***

Health and Safety Code Section 40727 requires that prior to adopting, amending, or repealing a rule or regulation, the South Coast AQMD Governing Board shall make findings of necessity,

<sup>69</sup> CARB. Proposed In-Use Locomotive Regulation Standardized Regulatory Impact Assessment (SRIA): <https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2022/locomotive22/appb.pdf>

authority, clarity, consistency, non-duplication, and reference based on relevant information presented at the public hearing and in the staff report.

### **Necessity**

PR 2306 is needed to protect public health by reducing local and regional emissions of NO<sub>x</sub> associated with freight rail yards and the mobile sources attracted to freight rail yards. By reducing these emissions, PR 2306 will also assist in meeting state and federal air quality standards for ozone and PM<sub>2.5</sub>. NO<sub>x</sub> is a precursor to the formation of ozone and PM<sub>2.5</sub>. PR 316.2 is needed to recover South Coast AQMD costs of implementing PR 2306.

### **Authority**

Authority for the South Coast AQMD Governing Board to adopt PR 2306 and PR 316.2 may be found in Health and Safety Code Sections 39002, 39650 through 39669, 40000, 40001, 40440, 40441, 40522.5, 40701, 40702, 40716, 40717, 40725 through 40728, 40910, 40920.5, 41508, 41511, and 41700 of the Health and Safety Code.

### **Clarity**

PR 2306 and PR 316.2 are written or displayed so that their meaning can be easily understood by the persons directly affected by them.

### **Consistency**

PR 2306 and PR 316.2 are in harmony with and not in conflict with or contradictory to, existing statutes, court decisions, or state or federal regulations.

### **Non-Duplication**

PR 2306 and PR 316.2 will not impose the same requirements as any existing state or federal regulations. Proportional or more-than-proportional emission reductions in the South Coast AQMD relative to statewide average emission reductions are not guaranteed from implementation of state regulations alone. PR 2306 is designed to ensure these necessary emission reductions occur within the South Coast AQMD. The proposed rules are necessary and proper to execute the powers and duties granted to, and imposed upon, the South Coast AQMD.

### **Reference**

In adopting these rules, the following statutes which the South Coast AQMD hereby implements, interprets, or makes specific are referenced: Clean Air Act Sections 110(a)(5)(C); 116; Health & Safety Code Sections 40440, 40716, 40717, and 40522.5.

### ***COMPARATIVE ANALYSIS***

Health and Safety Code Section 40727.2 requires South Coast AQMD to perform a comparative written analysis when adopting or amending a rule or regulation that imposes a new or more stringent emission limit or monitoring, reporting, or recordkeeping requirement. The comparative analysis is relative to existing federal requirements, existing or proposed South Coast AQMD rules and air pollution control requirements and guidelines which are applicable to the same sources as identified in the proposed rule or regulation. PR 2306 regulates NO<sub>x</sub> emissions from freight rail yards as indirect sources that attract mobile sources of emissions, and PR 316.2 is the companion fee rule for PR 2306. Under Health and Safety Code Section 40727.2(g), PR 316.2 does not in

itself require a comparative analysis but is included for completeness. PR 2306 and PR 316.2 are summarized in Table 4-19.

**Table 4-19. PR 2306 and PR 316.2**

Rules	Rule Elements		
	Applicability	Requirements	Reporting, Notification, and Recordkeeping
PR 2306	<ul style="list-style-type: none"> <li>- Owners or operators of proposed, new, and existing freight rail yards located within the South Coast AQMD</li> <li>- Any state or local government agency who enters into a contractual agreement with the owner or operator of such freight rail yards in relation to the freight rail yard lease, construction, or operation</li> </ul>	<ul style="list-style-type: none"> <li>- Freight rail yards must meet or exceed facility emission reductions targets for milestone years, with emission reductions from one or more freight rail yard sources of emissions using one of multiple compliance pathways</li> <li>- Requirement for submission of a request to the local electrical utility if there is a need to upgrade the electrical service</li> <li>- Requirement for the new owner or operator of a freight rail yard to obtain previously reported information and data</li> </ul>	<ul style="list-style-type: none"> <li>- Initial and milestone compliance reports to include necessary information and data to demonstrate compliance with PR 2306</li> <li>- Initial and milestone zero emission infrastructure reports on planning, development, and utilization of zero emission infrastructure</li> <li>- Submit a notification on changes in freight rail yard owner or operator</li> <li>- Submit a notification on freight rail yard shutdown including the potential date</li> <li>- Submit a notification upon exceeding the switching activity threshold as established by PR 2306 for operator of a freight rail yard that is previously qualified for low activity exemption</li> <li>- Submit a notification prior to construction of or conversion into a New Freight Rail Yard or the expansion of an existing Freight Rail Yard</li> <li>- Recordkeeping to support compliance information</li> </ul>

Rules	Rule Elements		
	Applicability	Requirements	Reporting, Notification, and Recordkeeping
			submitted per initial and milestone reports
PR 316.2	Owners and operators of proposed, new, and existing freight rail yards subject to PR 2306 reporting and notification requirements	Freight rail yard owners and operators that submit reports or notifications required by rule 2306 must submit applicable fees, due by the report/notification submittal due date	N/A

PR 2306 is part of a suite of AQMP Facility Based Mobile Source Measures aimed at collectively addressing freight emissions. South Coast AQMD adopted Rule 2305 in 2021 to address emission associated with warehouses and is in active rulemaking on marine ports (PR 2304); however, no draft rule language for PR 2304 has been released as of the date of this report, and the proposed rule concept is still in development. At the same time, there are several air quality regulations at the state and federal level that focus on emissions from the mobile sources associated with freight rail yards. These can broadly be placed into three categories. First are regulations that aim to reduce emissions through the engine standards for new vehicles (Table 4-20). Second are regulations that aim to replace older vehicles with newer vehicles with cleaner technologies through fleet rules (Table 4-21). Third are regulations that focus on air quality impacts from facilities that attract mobile sources (Table 4-22). A comparative analysis of other regulations that focus on emissions from the mobile sources associated with freight rail yards is presented in Tables 4-20 to 4-22.

**Table 4-20. Engine Standards**

Rules	Rule Elements		
	Applicability	Requirements	Reporting, Notification, and Recordkeeping

## ***INTRODUCTION***

The California Environmental Quality Act (CEQA) is comprised of Public Resources Code Section 21000 et seq. and the CEQA Guidelines which are codified at Title 14 California Code of Regulations, Section 15000 et seq. CEQA requires the evaluation of all potential adverse environmental impacts of proposed projects, and the identification and implementation of methods to reduce or avoid significant adverse environmental impacts of these projects, if feasible. [Public Resources Code Section 21061.1 and CEQA Guidelines Section 15364 define feasible]. The purpose of the CEQA process is to inform decision makers, public agencies, and interested parties of potential adverse environmental impacts that could result from implementing a proposed project and to identify feasible mitigation measures or alternatives, when an impact is significant.

The concept of regulating emissions from freight rail yards emerged from development of the 2016 AQMP,<sup>88</sup> describing a year-long process during which time potential emission reduction strategies for a suite of facility-based mobile source measures were evaluated and after which a report of the most promising approach was provided to the South Coast AQMD Governing Board. South Coast AQMD staff convened a working group which explored potential voluntary and regulatory approaches for both new and existing freight rail yards consistent with what was outlined in the 2016 AQMP for Control Measure MOB-02 – Emission Reductions at Rail Yards and Intermodal Facilities. This control measure specified the following criteria: “identified actions can be voluntary or can be regulations or other enforceable mechanisms promulgated by a local, state, or federal agency. Voluntary actions include, but are not limited to, greater deployment of zero and near-zero emission technologies, greater use of renewable fuels that may have the potential to reduce criteria pollutant emissions, and strategies that result in improved operational efficiencies with criteria pollutant and greenhouse gas emission reduction benefits.” In May 2018, the Governing Board directed staff to initiate rulemaking for new and existing freight rail yards. Staff met with stakeholders and held working group meetings, and in the midst of this process, the 2022 AQMP<sup>89</sup> was adopted.

The development of the 2022 AQMP contained facility-based mobile source measures similar to Control Measure MOB-02 from the 2016 AQMP and continued to explore potential ways to regulate emissions from freight rail yards through: 1) proposing the development of “Further Deployment of Cleaner Technologies” control measures (Further Deployment Measures) to assist the California Air Resources Board (CARB) and U.S. Environmental Protection Agency (U.S. EPA); 2) bifurcating Control Measure MOB-02 – Emission Reductions at Rail Yards and Intermodal Facilities of the 2016 AQMP, into two control measures: MOB-02A – Emission Reductions at New Rail Yards and Intermodal Facilities and MOB-02B – Emission Reductions at Existing Rail Yards and Intermodal Facilities; and 3) relying on the CARB 2022 State Strategy for the State Implementation Plan (2022 SIP Strategy). Control Measures MOB-02A and MOB-02B of the 2022 AQMP expanded upon the Control Measure MOB-02 of the 2016 AQMP by seeking to reduce NOx and PM emissions related to on-road heavy-duty vehicles, off-road equipment, and locomotives at freight rail yards and intermodal facilities. Specifically, Control Measure MOB-2A focused on achieving emission reductions at new freight rail yards and intermodal facilities,

<sup>88</sup> South Coast AQMD, 2016 Air Quality Management Plan, March 2017. <https://www.aqmd.gov/home/air-quality/air-quality-management-plans/final-2016-aqmp>

<sup>89</sup> South Coast AQMD, 2022 Air Quality Management Plan, December 2022. <https://www.aqmd.gov/home/air-quality/air-quality-management-plans/air-quality-mgt-plan>

whereas Control Measure MOB-2B focused on achieving emission reductions at existing freight rail yards and intermodal facilities.

After exploring both regulatory and voluntary approaches, rule development of PR 2306 and PR 316.2 are designed to address emissions from both new and existing freight rail yards. Specifically, PR 2306 is designed to implement Control Measure MOB-02 of 2016 AQMP, and Control Measures MOB-02A and MOB-02B of the 2022 AQMP and will ensure that emission reductions will be achieved within the South Coast AQMD jurisdiction at levels that are proportional or more-than-proportional to reductions throughout California from implementation of recently adopted statewide regulations affecting freight rail yard emission sources. Emission reductions targets in PR 2306 are expected to be achieved through reductions from one or more freight rail yard emission sources, including locomotives and drayage trucks subject to these two CARB regulations, as well as from all other mobile sources associated with freight rail yards to transport or assist in transporting cargo or goods. Additional emission reductions may be achieved in South Coast AQMD if implementation of statewide regulations alone does not result in compliance with PR 2306.

PR 2306 affects 25 freight rail yards, and the on-road and off-road mobile emission sources covered under PR 2306 include: 1) locomotives powering inbound and outbound trains; 2) heavy-duty trucks delivering or picking up cargo (full or empty containers) to and from freight rail yards; 3) cargo handling equipment (CHE) used for moving and handling cargo within freight rail yards; 4) transport refrigeration units (TRU) on containers, trailers, railcars, and trucks; and 5) other supporting equipment (OSE). These mobile sources account for the majority of emissions from freight rail yards.

PR 2306 includes requirements for owners and operators of freight rail yards to submit four types of reports: 1) an Initial Facility Information Report which includes a freight rail yard's operational data that is required to determine emissions during the base period and to gather information that is used in calculating NOx percent emission reductions for a freight rail yard with reduced throughputs; 2) an Initial Zero Emission Infrastructure Report to provide an overview of currently operating, planned, developing, and future on-site or off-site zero emission infrastructure in support of freight rail yard compliance with In-Use Locomotive Regulation, Advanced Clean Fleets (ACF) regulation, and/or any other zero emission infrastructure requirements and initiatives; 3) Milestone Compliance Reports every three years for freight rail yard operators to demonstrate compliance with PR 2306 for each and every milestone year; and 4) Zero Emission Infrastructure Status Update Reports which include information pertaining to installed and operating on-site or off-site zero emission infrastructure (as specified in PR 2306 Table 4), updates on new or ongoing on-site or off-site zero emission infrastructure projects currently under development (as specified in PR 2306 Table 5), and updates on planning of future on-site and off-site zero emission infrastructure that are needed to implement and comply with CARB's regulations, as well as the control measures for TRUs and CHE as specified in the 2022 State Strategy for the SIP (as specified in PR 2306 Table 6). Regarding zero emissions planning for all freight rail yards, specific site details are critical for developing a zero emissions infrastructure plan. For example, details need to include evaluating how many locomotives, as well as pieces of CHE, OSE, and TRUs, would need to be fueled or charged, at what rate, at which locations onsite, whether energy storage will also be included to provide redundancy and/or price moderation, what types of chargers or fueling dispensers will be used, etc.

At the time the 2022 AQMP and 2016 AQMP were developed, each plan was considered a “project” as defined by CEQA Guidelines Section 15378 and South Coast AQMD was the lead agency under CEQA because it was the “public agency that has the principal responsibility for carrying out or approving a project that may have a significant effect upon the environment.” [Public Resources Code Section 21067]. Further, since the South Coast AQMD Governing Board had the primary responsibility for approving the entirety of both projects, South Coast AQMD was the most appropriate public agency to act as lead agency for the projects. [CEQA Guidelines Section 15051(b)].

The 2022 AQMP and 2016 AQMP each: 1) had environmental impacts which were evaluated in a Final Program Environmental Impact Report (Program EIR); and 2) were discretionary actions which were individually considered and approved by the South Coast AQMD Governing Board.

Therefore, PR 2306, is integrally related to the 2022 AQMP and the 2016 AQMP for which two previous environmental analyses have been prepared: 1) the Final Program EIR for 2022 AQMP which was certified by the South Coast AQMD Governing Board on December 2, 2022<sup>90</sup>; and 2) the Final Program EIR for 2016 AQMP which was certified by the South Coast AQMD Governing Board on March 3, 2017.<sup>91</sup>

The Final Program EIRs for the 2022 AQMP and 2016 AQMP identified potentially significant impacts, and mitigation measures were adopted for each plan. Further, since mitigation measures were adopted for the 2022 AQMP and 2016 AQMP; Mitigation, Monitoring, and Reporting Plans, pursuant to Public Resources Code Section 21081.6 and CEQA Guidelines 15097 were also required and adopted.

Further, because the Final Program EIRs for both AQMPs concluded that implementation of these two projects would have potentially significant and unavoidable adverse impacts on the environment, Findings were made pursuant to CEQA Guidelines Section 15091, and Statements of Overriding Considerations pursuant to CEQA Guidelines Section 15093 were adopted.

The 2022 AQMP, along with the December 2022 Final Program EIR for the 2022 AQMP (State Clearinghouse No. 2022050287) and its corresponding Findings, Statement of Overriding Considerations, and Mitigation, Monitoring, and Reporting Plan, and the 2016 AQMP along with the March 2017 Final Program EIR for the 2016 AQMP (State Clearinghouse No. 2016071006) and its corresponding with Findings, Statement of Overriding Considerations, and Mitigation, Monitoring, and Reporting Plan, upon which this analysis of PR 2306 relies, are incorporated by reference pursuant to CEQA Guidelines Section 15150 and are available from the South Coast AQMD’s website at:

Phone: (909) 396-2432  
Email: [publicadvisor@aqmd.gov](mailto:publicadvisor@aqmd.gov)

For both of these projects, a Program EIR was considered to be the appropriate document for each AQMP pursuant to CEQA Guidelines Section 15168(a)(3) because each AQMP constituted a series of actions that can be characterized as one large project in connection with the issuance of rules, regulations, plans, or other general criteria required to govern the conduct of a continuing program. In addition, the use of a Program EIR had the following advantages by:

- Providing an occasion for a more exhaustive consideration of effects and alternatives than would be practical in an EIR on an individual action;
- Ensuring a consideration of cumulative impacts that might be slighted in a case-by-case analysis;
- Avoiding duplicative reconsideration of basic policy considerations;
- Allowing consideration of broad policy alternatives and program-wide mitigation measures at an early time when the Lead Agency has greater flexibility to deal with basic problems of cumulative impacts; and
- Allowing its use with a later activity if the later activity is within the scope of the project analyzed in the Program EIR without requiring further environmental documents.

While PR 2306 is a new rule, it memorializes and implements previously adopted control measures from the 2022 AQMP and the 2016 AQMP without introducing new requirements with new environmental impacts beyond what was previously analyzed in the Final Program EIRs for the 2022 AQMP and 2016 AQMP. In addition, PR 2306 is intended to supplement the local implementation of CARB's In-Use Locomotive and ACF regulations, within South Coast AQMD by requiring all freight rail yards to meet set emission reductions targets for milestone years.

CARB's In-Use Locomotive Regulation is designed to reduce toxic air contaminants, criteria pollutants, and GHG emissions from in-use locomotives (e.g., all switch, passenger, industrial, and freight line haul locomotives) operated in California. Specifically, CARB's In-Use Locomotive Regulation requires locomotive operators to: 1) set aside money for cleaner locomotives and technology development; 2) incentivize early zero emission operation in disadvantaged communities; 3) starting in 2030, require locomotives operating in California to be less than 23 years old to phase out the oldest and dirtiest locomotives (locomotives aged 23 years or older may operate in California if they meet the cleanest U.S. EPA standards (in earlier years) and operate only in zero-emission configuration (in later years); 4) establish zero emission operational requirements for locomotives operating in 2030 and later; 5) require a 30-minute idling limit; and 6) require air district-specific reporting of California locomotive activity. On April 27, 2023, CARB certified a Final Environmental Analysis for the In-Use Locomotive Regulation (State Clearinghouse No. 2022090408)<sup>92</sup> which analyzed the environmental impacts associated with implementing this regulation.

---

<sup>92</sup> CARB, 2023. Final Environmental Analysis for the Proposed In-Use Locomotive Regulation, April 14, 2023.

CARB's ACF Regulation requires certain fleets, including drayage trucks, to deploy medium- and heavy-duty zero emission vehicles starting in 2024 and establishes a clear end date to new medium and heavy-duty vehicle internal combustion engine vehicle sales in 2036. On August 28, 2023, CARB certified a Final Environmental Analysis for the ACF Regulation (State Clearinghouse No. 2021030340).<sup>93</sup>

So as to not repeat or duplicate the environmental analyses previously conducted in CARB's CEQA documents for these two adopted regulations, to which PR 2306 is supplement, this Appendix incorporates by reference in accordance with CEQA Guidelines Section 15150 the following documents which are a matter of public record and are available to the public from CARB's website:

CEQA Guidelines Section 15187 requires South Coast AQMD to perform an environmental analysis when proposing to adopt a new rule or regulation requiring the installation of air pollution control equipment, or establishing a performance standard, which is the case with PR 2306. CEQA Guidelines 15187(c) requires the environmental analysis to include at least the following information:

- An analysis of reasonably foreseeable environmental impacts of the methods of compliance;
- An analysis of reasonably foreseeable mitigation measures relating to those environmental impacts; and
- An analysis of reasonably foreseeable alternative means of compliance with the rule or regulation, which would avoid or eliminate the identified environmental impacts.

In analyzing the potential environmental impacts of PR 2306 as required by CEQA Guidelines Section 15187, South Coast AQMD finds that, pursuant to CEQA Guidelines Section 15162 that PR 2306 does not contain new information of substantial importance which was not known and could not have been known at the time of certification of: 1) Final Program EIR for the 2022 AQMP; and 2) the Final Program EIR for the 2016 AQMP. [CEQA Guidelines Section 15162(a)(3)]. Therefore, a Subsequent EIR is not required.

As such, this Appendix satisfies the environmental analysis requirement in CEQA Guidelines Section 15187 by examining whether PR 2306 qualifies as a later activity within the scope of the previous analyses conducted in the certified Final Program EIRs for the 2022 AQMP and the 2016 AQMP pursuant to CEQA Guidelines 15168(c) – Use with Later Activities. Specifically, this Appendix: 1) compares the proposed later activity of PR 2306 with the previously approved programs, Control Measures MOB-02A and MOB-02B which were adopted in the 2022 AQMP and Control Measure MOB-02 which was adopted in the 2016 AQMP; 2) summarizes the environmental impacts analyzed in the Final Program EIRs for the 2022 AQMP and 2016 AQMP for Control Measures MOB-02A, MOB-02B, and MOB-02; 3) identifies the differences, if any, between the analyses of environmental impacts in the Final Program EIRs for 2022 AQMP and 2016 AQMP for the applicable control measures and PR 2306 and, as needed, identifies any other

impact areas which may require further analysis; and 4) considers the evidence and determines whether: a) PR 2306 is a later activity within the scope of the programs approved earlier for the 2022 AQMP and 2016 AQMP; and b) the Final Program EIRs for the 2022 AQMP and the 2016 AQMP adequately describe the later activity of PR 2306 for the purposes of CEQA such that no new environmental document will be required.

As a companion rule to PR 2306, PR 316.2 establishes fees to be paid by freight rail yard owners or operators subject to PR 2306 to recover South Coast AQMD's reasonable regulatory costs associated with PR 2306 implementation and compliance, such as costs associated with review of reports and notifications and the associated auditing, inspection, and enforcement activities. Thus, PR 316.2, which involves charges established by a public agency (South Coast AQMD) for the purpose of meeting operating expenses, is statutorily exempt from CEQA pursuant to CEQA Guidelines Section 15273 and is not discussed further in this Appendix. A Notice of Exemption will be prepared pursuant to CEQA Guidelines Section 15062, and if the PR 316.2 is approved, the Notice of Exemption will be filed with the county clerks of Los Angeles, Orange, Riverside, and San Bernardino counties, and with the State Clearinghouse of the Governor's Office of Planning and Research.

#### ***SUMMARY OF ENVIRONMENTAL IMPACTS ASSOCIATED WITH PR 2306***

The CEQA Guidelines require environmental documents to identify significant environmental effects that may result from a proposed project. [CEQA Guidelines Section 15126.2(a)]. Direct and indirect significant effects of a project on the environment should be identified and described, with consideration given to both short- and long-term impacts. The discussion of environmental impacts may include, but is not limited to, the resources involved; physical changes; alterations of ecological systems; health and safety impacts caused by physical changes; and other aspects of the resources involved including water, scenic quality, and public services. If significant adverse environmental impacts are identified, the CEQA Guidelines require a discussion of measures that could either avoid or substantially reduce any adverse environmental impacts to the greatest extent feasible. [CEQA Guidelines Section 15126.4].

The categories of environmental impacts to be studied in a CEQA document are established by CEQA (Public Resources Code Section 21000 et seq.) and the CEQA Guidelines (codified in Title 14 California Code of Regulations Section 15000 et seq.). Under the CEQA Guidelines Appendix G: Environmental Checklist Form, there are 20 environmental topic areas categories in which potential adverse impacts from a project are evaluated. The South Coast AQMD, as lead agency, has taken into consideration the environmental checklist questions in Appendix G, but has reorganized the contents to consolidate the environmental topic areas to avoid repetition. For example, South Coast AQMD's customized the environmental checklist by: 1) combining the topics of "air quality" and "greenhouse gas emissions" into one section; 2) combining the topics of "cultural resources" and "tribal cultural resources" into one section; 3) separating the "hazards and hazardous materials" topic into two sections: "hazards and hazardous materials" and "solid and hazardous waste;" and 4) distributing the questions from the topic of "utilities/service systems" into other more specific environmental areas such as "energy," "hydrology and water quality," and "solid and hazardous waste." For each environmental topic area, per CEQA Guidelines Section 15064.7(a), "[a] threshold of significance is an identifiable quantitative, qualitative, or performance level of a particular environmental effect, noncompliance with which means the

effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant.” The South Coast AQMD has developed unique thresholds of significance for the determination of significance in accordance with CEQA Guidelines Section 15064.7(b).

The CEQA Guidelines also include provisions for the preparation of Program EIRs in connection with the issuance of plans, such as the 2022 AQMP and 2016 AQMP, to govern the conduct of a continuing program, including adoptions of broad policy programs as distinguished from those prepared for specific types of projects such as land use projects, for example. [CEQA Guidelines Section 15168]. A Program EIR also allows for the consideration of broad policy alternatives and program-wide mitigation measures at an early time when an agency has greater flexibility to deal with basic problems or cumulative impacts. [CEQA Guidelines Section 15168 (b)(4)]. Lastly, a Program EIR also plays an important role in establishing a structure within which a CEQA review of future related actions can be effectively conducted. A Program EIR, by design, provides the basis for future environmental analyses and will allow future project specific CEQA documents, if necessary, to focus solely on the new effects or detailed environmental issues not previously considered. If an agency finds that no new effects could occur, or no new mitigation measures would be required, the agency can approve the activity as being within the scope of the project covered by the Program EIR and no new environmental document would be required. [CEQA Guidelines Section 15168(c)(2)].

The Final Program EIR for the 2016 AQMP analyzed the impacts of the 2016 AQMP project on 18 environmental topic areas: aesthetics, agriculture and forestry resources, air quality and greenhouse gas emissions, biological resources, cultural resources, energy, geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, mineral resources, noise, population and housing, public services, recreation, solid and hazardous waste, transportation and traffic, and mandatory findings of significance. In 2019, the CEQA Guidelines were amended to add the environmental topic areas of tribal cultural resources and wildfires, and the transportation analysis was changed from Level of Service (LOS) to Vehicle Miles Traveled (VMT) with a corresponding update to the name of the environmental topic area from “transportation and traffic” to “transportation.” Thus, the Final Program EIR for the 2022 AQMP analyzed the impacts of implementing the various control measures in the 2022 AQMP on 19 environmental topic areas: aesthetics, agriculture and forestry resources, air quality and greenhouse gas emissions, biological resources, cultural and tribal cultural resources, energy, geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, mineral resources, noise, population and housing, public services, recreation, solid and hazardous waste, transportation, wildfire, and mandatory findings of significance.

The Final Program EIR for the 2022 AQMP concluded that the implementation of all of the control measures in the 2022 AQMP would result in potentially significant impacts for the following environmental topic areas: air quality and greenhouse gas (GHG) emissions, energy, hazards and hazardous materials, hydrology and water quality, noise, and solid and hazardous waste. All other environmental topic areas were either concluded to have less than significant impacts or no impact. Mitigation measures to minimize significant impacts from implementation of the 2022 AQMP

were adopted in the Mitigation, Monitoring, and Reporting Plan which can be found in Attachment 1 to the Governing Board Resolution for the Final Program EIR for the 2022 AQMP.<sup>94</sup>

The Final Program EIR for the 2016 AQMP concluded that the implementation of all of the control measures in the 2016 AQMP would result in potentially significant impacts for the following environmental topic areas: aesthetics, air quality and greenhouse gas emissions, energy, hazards and hazardous materials, hydrology and water quality, noise, solid and hazardous waste, and transportation and traffic. All other environmental topic areas were either concluded to have less than significant impacts or no impact. Mitigation measures to minimize significant impacts from implementation of the 2016 AQMP were adopted in the Mitigation, Monitoring, and Reporting Plan which can be found in Attachment 2 to the Governing Board Resolution for the Final Program EIR for the 2016 AQMP.<sup>95</sup>

Table A-1 summarizes Control Measures MOB-02A and MOB-02B of the 2022 AQMP and Control Measure MOB-02 of the 2016 AQMP upon which PR 2306 relies, their effect of implementation and nature of potential impact(s), and which of the environmental topic areas are potentially adversely impacted by their implementation. It should be noted that Control Measures MOB-02A and MOB-02B were concluded in the Final Program EIR for the 2022 AQMP to have potential adverse impacts related to the environmental topic areas of air quality and GHG, energy, hazards and hazardous materials, noise, and solid and hazardous waste, but no potential adverse impacts to the environmental topic area of hydrology and water quality. However, for other control measures in the 2022 AQMP, the Final Program EIR for the 2022 AQMP concluded that there would be potential adverse impacts to hydrology and water quality. Control Measure MOB-02 of the 2016 AQMP considered potential adverse impacts to surface and ground water quality from accidental spills of alternative fuels or additives, and potential illegal disposal of batteries from electric vehicles and hybrids while Control Measures MOB-2A and MOB-2B of the 2022 AQMP did not. Control Measure MOB-02 was concluded in the Final Program EIR for the 2016 AQMP to have potential adverse impacts related to the environmental topic areas of air quality and GHG, energy, hazards and hazardous materials, hydrology and water quality, noise, and solid and hazardous waste, but no potential adverse impacts to the environmental topic areas of aesthetics and transportation and traffic. Implementing other control measures in the 2016 AQMP was concluded in the Final Program EIR for the 2016 AQMP to have potential adverse impacts to aesthetics and transportation and traffic as a result of implementing other control measures.

Tables A-2 and A-3 summarize the analyses in the Final Program EIRs for the 2022 AQMP and 2016 AQMP associated with Control Measures MOB-02A, MOB-02B, and MOB-02: physical changes expected, environmental topic areas affected according to level of significance impact, and the applicable mitigation measures.

Table A-4 summarizes the physical changes expected, environmental topic areas affected, and the applicable mitigation measures associated with implementation of PR 2306 and compares the

similarities to those analyzed for Control Measures MOB-02A, MOB-02B, and MOB-02 in the Final Program EIRs for the 2022 AQMP and 2016 AQMP.

**Table A- 1. Environmental Topic Areas with Potential Adverse Impacts from Rail Yard Control Measures**

Control Measure Number	Title	Effect of Implementation and Nature of Potential Impact(s)	Potential Adverse Impact(s)					
			Air Quality/ GHG	Energy	Hazards/ Hazardous Materials	Hydrology/ Water Quality	Noise	Solid/ Hazardous Waste
MOB-02A in 2022 AQMP	Emission Reductions at New Rail Yards and Intermodal Facilities	Infrastructure development required to achieve emission reductions at new rail yards and intermodal facilities from on-road heavy-duty vehicles, off-road equipment, and locomotives may cause impacts to: 1) air quality and GHGs from construction activities and the combustion of alternative fuels; 2) energy due to increased demand for electricity (for vehicles, rail, and equipment) and natural gas; 3) hazards and hazardous materials associated with engine replacements; 4) noise during construction; and 5) solid and hazardous waste associated with engine replacements.	X	X	X		X	X
MOB-02B in 2022 AQMP	Emission Reductions at Existing Rail Yards and Intermodal Facilities	Infrastructure development required to achieve emission reductions at existing rail yards and intermodal facilities from on-road heavy-duty vehicles, off-road equipment, and locomotives may cause impacts to: 1) air quality and GHGs from construction activities and the combustion of alternative fuels; 2) energy due to increased demand for electricity (for vehicles, rail, and equipment) and natural gas; 3) hazards and hazardous materials associated with engine replacements; 4) noise during construction; and 5) solid and hazardous waste associated with engine replacements.	X	X	X		X	X
MOB-02 in 2016 AQMP	Emission Reductions at Rail Yards and Intermodal Facilities	Constructing infrastructure to provide support for new cleaner equipment or vehicles, and accelerating the penetration of zero and near-zero emission locomotives can result in air and energy (electrical/natural gas demand) impacts. Hazard impacts can result from the use of alternative fuels and fuel additive. Water (surface and ground) impacts can result from accidental spills. Waste impacts can result from battery disposal and turnover of older equipment.	X	X	X	X	X	X

**Table A-4. Comparison of Environmental Impacts between MOB-02A, MOB-02B, MOB-02, and PR 2306 (concluded)**

Physical Change Expected from PR 2306	Similarity to Environmental Topic Areas with Potentially Significant Impacts	Applicability of Adopted Mitigation Measures	Similarity to Environmental Topic Areas with Less than Significant Impacts	Similarity to Environmental Topic Areas with No Impacts
<p><i>Operation</i></p> <p>Potential acceleration in the purchase of zero emission or low NOx emitting equipment and vehicles that would replace older equipment and vehicles, thereby increasing the scrapping of equipment and vehicles faster than would normally occur could result in physical changes.</p>	<ul style="list-style-type: none"> <li>- Solid and Hazardous Waste</li> </ul> <p><i>Implementation of PR 2306 is expected to result in the same potentially significant impacts anticipated for the potential acceleration in scrapping of equipment and vehicles from Control Measures MOB-02A and MOB-02B of the 2022 AQMP and Control Measure MOB-02 of the 2016 AQMP.</i></p>	<p><b>Solid and Hazardous Waste:</b> SHW-1 to SHW-3 of the Final Program EIR for the 2022 AQMP</p> <p><i>The mitigation measures minimizing impacts on the potential acceleration in scrapping of equipment and vehicles from Control Measures MOB-02A and MOB-02B of the 2022 AQMP and Control Measure MOB-02 of the 2016 AQMP are expected to apply to PR 2306.</i></p>	<ul style="list-style-type: none"> <li>- Hydrology and Water Quality</li> </ul> <p><i>Implementation of PR 2306 is expected to result in the same less than significant impacts anticipated for the potential acceleration in scrapping of equipment and vehicles from Control Measures MOB-02A and MOB-02B of the 2022 AQMP and Control Measure MOB-02 of the 2016 AQMP.</i></p>	<ul style="list-style-type: none"> <li>- Aesthetics</li> <li>- Agriculture and Forestry Resources</li> <li>- Air Quality and GHG</li> <li>- Biological Resources</li> <li>- Cultural and Tribal Cultural Resources</li> <li>- Energy</li> <li>- Geology and Soils</li> <li>- Hazards and Hazardous Materials</li> <li>- Land Use and Planning</li> <li>- Mineral Resources</li> <li>- Noise</li> <li>- Population and Housing</li> <li>- Public Services</li> <li>- Recreation</li> <li>- Transportation</li> <li>- Wildfire</li> </ul> <p><i>Same as for the potential acceleration in scrapping of equipment and vehicles from Control Measures MOB-02A and MOB-02B of the 2022 AQMP and Control Measure MOB-02 of the 2016 AQMP.</i></p>

PR 2306 implements Control Measures MOB-02A and MOB-02B of the 2022 AQMP, and Control Measure MOB-02 of 2016 AQMP, and will require operators of freight rail yards in South Coast AQMD to reduce their facility emissions at levels that are proportional or more-than-proportional to statewide implementation of CARB's In-Use Locomotive and ACF regulations, part of CARB's 2022 SIP Strategy. While PR 2306 does not explicitly mandate zero emission infrastructure, its implementation will generate increased demand for electricity and alternative fuels to support freight rail yard operations in the South Coast Air Basin (Basin). Consequently, existing utility supply and distribution systems may require capacity upgrades to meet this demand. These enhancements would constitute off-site infrastructure improvements, encompassing electricity generation resources, transmission capacity, and distribution system capacity (such as additional substations and circuits), along with hydrogen fuel production, storage, and distribution systems.

PR 2306 does not require a specific pathway to be followed to reach the facility emission reduction milestones, but its implementation, in conjunction with CARB regulations affecting freight rail yard sources of emissions, will likely accelerate the purchase of zero emission capable or low NOx emitting equipment and vehicles that would replace older equipment and vehicles and thus, increase the scrapping of equipment and vehicles faster than would normally occur. All of these impacts associated with these infrastructure improvements and acceleration of cleaner technologies were previously analyzed in the Final EIRs for the 2022 AQMP and the 2016 AQMP. The precise level of zero emissions infrastructure through time that would be associated with PR 2306 is unknown. Under PR 2306 subparagraph (d)(1)(B), freight rail yard operators can demonstrate they meet facility-wide emission reduction targets that align with how they complied with CARB's In-Use Locomotive and Advanced Clean Fleets regulations. Both of those regulations allow substantial flexibility, and compliance at a facility level under PR 2306 may be possible with little to no implementation of zero emissions technology for many years (e.g., through reliance on widespread deployment of Tier 4 diesel engines rather than converting to zero emissions). Further, the type of zero emissions infrastructure may vary (e.g., fast or slow charging electrification, fast or slow fueling of hydrogen, etc.). It is speculative to determine how these impacts will occur with any more precision than what has been already analyzed in the Final Program EIRs for the 2022 AQMP and 2016 AQMP.

In addition, the owners/operators of the freight rail yards that will be subject to PR 2306 have not provided any site-specific details regarding any additional potential modifications and associated environmental impacts that could potentially occur at individual freight rail yard locations to comply with PR 2306 beyond what has been previously forecasted and analyzed in accordance with CEQA Guidelines Section 15144 in the Final Program EIRs for the 2022 AQMP and 2016 AQMP. Predicting what facilities would do without firm evidence based on facts to support the analysis would require speculation or conjecture that is inappropriate and prohibited by CEQA. [CEQA Guidelines Section 15145]. When project-level details and corresponding environmental information is not available and a particular impact is too speculative for evaluation, as is the case with individual freight rail yards that will be subject to PR 2306, no additional analysis is required for potential modifications that may occur at individual sites which are speculative. [CEQA Guidelines Section 15145]. Thus, the previous analyses of the environmental impacts for Control Measures MOB-02A and MOB-02B of the 2022 AQMP in its Final Program EIR, and Control Measure MOB-02 of 2016 AQMP in its Final Program EIR cover the breadth of impacts that are expected to result from PR 2306 such that no additional environmental impacts need to be evaluated.

The analyses in the Final Program EIRs for the 2022 AQMP and 2016 AQMP determined that implementation of Control Measures MOB-02A, MOB-02B, and MOB-02 has the potential to generate significant adverse impacts to air quality from construction, energy, hazards and hazardous materials, noise, and solid and hazardous waste; less than significant impacts to operational air quality and GHG, and hydrology and water quality; and no impacts to all other environmental topic areas.

### ***ENVIRONMENTAL TOPIC AREAS WITH POTENTIALLY SIGNIFICANT IMPACTS***

The Final Program EIR for the 2022 AQMP concluded that the implementation of all of the control measures in the 2022 AQMP would result in potentially significant impacts for the following environmental topic areas: air quality and greenhouse gas (GHG) emissions, energy, hazards and hazardous materials, hydrology and water quality, noise, and solid and hazardous waste. Specific to the implementation of Control Measures MOB-02A and MOB-02B, the Final Program EIR for the 2022 AQMP analyzed and concluded potentially significant impacts to the environmental topic areas of air quality from construction, energy, hazards and hazardous materials, noise, and solid and hazardous waste.

The Final Program EIR for the 2016 AQMP concluded that the implementation of all of the control measures in the 2016 AQMP would result in potentially significant impacts for the following environmental topic areas: aesthetics, air quality and greenhouse gas emissions, energy, hazards and hazardous materials, hydrology and water quality, noise, solid and hazardous waste, and transportation and traffic. Specific to the implementation of Control Measures MOB-02, the Final Program EIR for the 2016 AQMP analyzed and concluded potentially significant impacts to the environmental topic area of air quality from construction, energy, noise, and solid and hazardous waste.

Since PR 2306 implements control measures MOB-02A and MOB-02B of 2022 AQMP and Control Measure MOB-02 of 2016 AQMP without adding new or modifying the previously analyzed impacts for each environmental topic area, the overall conclusion of potentially significant impacts in the Final Program EIR for the 2022 AQMP and the Final Program EIR for the 2016 AQMP will remain unchanged if PR 2306 is implemented.

The following section summarizes the analyses of potentially significant impacts from the implementing Control Measures MOB-02A and MOB-02B of the 2022 AQMP and Control Measure MOB-02 of the 2016 AQMP, upon which PR 2306 relies, for the topics of air quality from construction, energy, hazards and hazardous materials, noise, and solid and hazardous waste. The significance criteria, potential impacts, applicable mitigation measures, and cumulative impacts will be discussed for each environmental topic area.

### **Air Quality from Construction**

Implementing control measures from both the 2022 AQMP and 2016 AQMP is expected to decrease operational emissions of criteria pollutants over the long-term, resulting in a benefit to air quality. However, in order to realize this benefit, various types of construction activities will be necessary to implement most control measures including Control Measures MOB-02A and MOB-02B of the 2022 AQMP and Control Measure MOB-02 of the 2016 AQMP. However, construction is generally characterized as a temporary, short-term activity which will contribute to adverse air quality impacts. Potentially significant impacts to air quality from construction will be discussed in this section, while less than significant impacts to air quality from operation and

greenhouse gas (GHG) emissions will be discussed in a later section entitled “Environmental Topic Areas with Less than Significant or No Impacts.” The Final Program EIR for the 2022 AQMP considered and evaluated the construction and installation of infrastructure to support use of additional electricity and alternative fuels from Control Measures MOB-02A and MOB-02B. Similarly, the Final Program EIR for the 2016 AQMP evaluated construction impacts from Control Measure MOB-02 along with a suite of other control measures associated with installing infrastructure to provide support for new cleaner equipment or vehicles. The Final Program EIR for 2016 AQMP analyzed the potential air quality impacts from constructing infrastructure to provide support for new cleaner equipment or vehicles by focusing on the following key components: 1) development of baseline and future regional emission inventories for all quantifiable emissions sources in the Basin, as detailed in 2016 AQMP Appendix IV-A<sup>96</sup>, which form the basis for understanding the magnitude of emissions associated with various construction phases; 2) assumption that all off-road equipment used in construction activities, including grading, paving, and the installation of air pollution control devices, contribute to construction emissions; 3) quantification of estimated emission from construction activities for each phase, including emissions from on-road vehicles transporting workers, vendors, and materials to and from construction sites; 4) comparison of estimated emissions from construction activities to established thresholds set by the South Coast AQMD to determine whether emissions are considered significant and could potentially lead to adverse localized air quality impacts; and 5) recognition that while emissions from individual construction projects at specific facilities may not exceed significance thresholds, concurrent, overlapping construction activities across multiple sites could exceed the significance thresholds. Based on the analysis, the Final Program EIR for the 2016 AQMP concluded significant construction air quality impacts and as such, identified and adopted mitigation measures to reduce construction emissions. These mitigation measures were designed to minimize the adverse environmental impacts while supporting the AQMP’s goal of achieving and maintaining compliance with the national and state ambient air quality standards across the region.

### *Significance Criteria*

A threshold of significance is an identifiable quantitative, qualitative, or performance level of a particular environmental effect. Proposed projects that do not exceed the significance threshold for the effect under evaluation normally will be determined to be less than significant. Exceeding any significance threshold means the effect will normally be determined to be significant by the lead agency. [CEQA Guidelines Sections 15064(a) and (b)(2); Section 15064.7(a)].

To determine whether air quality and GHG emissions impacts from the 2022 AQMP and the 2016 AQMP were significant, the Final Program EIRs for the 2022 AQMP and 2016 AQMP estimated the potential emissions of criteria pollutants, toxic air contaminants, and GHGs and compared those estimates to the significance criteria in Table A-5.

### *Air Quality Impacts from Construction*<sup>97</sup>

The Final Program EIR for the 2022 AQMP considered that implementation of Control Measures MOB-02A and MOB-02B requires construction of infrastructure for fuel/energy producing facilities to be able to supply electricity, hydrogen, and natural gas for alternative-fueled off- and on-road vehicles and equipment (see Final Program EIR for the 2022 AQMP, Table 4.2-3). While the scope of what it would take to build the additional electricity generating equipment and alternative fuels production equipment at either existing or new facilities is unknown, emissions from major construction activities associated with capital improvement projects are typically greater and for a longer period of time than construction emissions resulting from the installation of air pollution control equipment. To illustrate potential overlapping construction activities on a peak day, the Final Program EIR for the 2022 AQMP presented a compilation of the estimated construction emissions typical of equipment replacement in residential and commercial settings, air pollution control equipment installations, with construction emission estimates for producing renewable or alternative fuels. While individually, most components of the construction activities would not have emissions exceeding the South Coast AQMD's air quality significance thresholds, it is foreseeable and likely that on any given day, construction activities associated with one or more new or existing air pollution control devices overlapping with other types of construction activities associated with producing alternative fuels in order to comply with the 2022 AQMP could occur at more than one facility. Based on the size of any single project, or if more than one facility were concurrently constructed on any given day, the emissions would exceed the South Coast AQMD's air quality significance thresholds. Therefore, construction emissions were considered potentially significant.

Because the construction air quality impacts from implementing the 2022 AQMP were concluded to be significant, feasible mitigation measures AQ-1 to AQ-26 for reducing impacts related to construction were adopted in the Final Program EIR for the 2022 AQMP, and these mitigation measures apply to Control Measures MOB-02A and MOB-02B, upon which PR 2306 relies (see pages 4.2-22 to 4.2-24 of the Final Program EIR for the 2022 AQMP). Even after mitigation measures AQ-1 to AQ-26 were applied, the Final Program EIR for the 2022 AQMP concluded that construction air quality impacts would remain significant.

The Final Program EIR for the 2016 AQMP considered that implementation of Control Measure MOB-02 had the potential to generate construction emission impacts from constructing infrastructure to provide support for new cleaner equipment or vehicles. The Final Program EIR for the 2016 AQMP analyzed a typical construction scenario of an air pollution control device at an existing facility which consisted of the following phases and associated on-road and off-road construction equipment:

- Grading/Site Preparation: Rubber Tired Dozers, Tractors/Loaders/Backhoes, Construction Workers' Vehicles, and Medium Duty Trucks
- Paving: Pavers, Cement/Mortar Mixers, Rollers, Construction Workers' Vehicles, and Medium Duty Trucks
- Installing/Constructing Air Pollution Control Device(s): Cranes, Forklifts, Tractors/Loaders/Backhoes, Construction Workers' Vehicles, and Medium Duty Trucks

---

<sup>97</sup> See Section 4.2.5.1 Criteria Pollutants – Construction Activities of the Final Program EIR for the 2022 AQMP and Section 4.1.6.1 Criteria Pollutants – Construction Activities of the Final Program EIR for the 2016 AQMP

Construction emissions were estimated for these various construction phases associated with the installation of air pollution control devices. In addition, criteria pollutant emissions were calculated for all on-road vehicles transporting workers, vendors, and material removal and delivery. The analysis assumed that each phase must be entirely completed before the next phase can commence such that there would be no overlap of construction phases for the construction of the new control devices. Table A-6, which is Table 4.1-3 Typical Peak Daily Construction Emissions for Control Devices in the Basin (lbs/day) from the Final Program EIR for the 2016 AQMP, summarizes the construction emissions that would be expected to occur as a result of installing one air pollution control device at one facility. Although the construction emissions at each individual facility might not exceed the South Coast AQMD's air quality significance thresholds, it was foreseeable and likely that on any given day, construction of one or more control devices in order to comply with the 2016 AQMP could occur at more than one facility. Based on the results in Table A-6, if more than four facilities or more than four control devices were concurrently constructed on any given day, the emissions would exceed the South Coast AQMD air quality significance thresholds. Therefore, construction emissions were considered significant.

**Table A-6. Typical Peak Daily Construction Emissions for Control Devices in the Basin (lbs/day)**

Source Category	VOC	NO <sub>x</sub>	CO	SO <sub>x</sub>	PM10	PM2.5
Grading/Site Preparation	2.7	25	11	0.0	3.9	1.6
Paving	0.2	12	8	0.01	0.7	0.7
Device Installation	3.4	30	15	0.0	1.4	1.3
Maximum Emissions (1 Facility)	3.4	30	15	0.01	3.9	1.6
Maximum Emissions (4 Facilities)	13.6	120	60	0.04	15.6	6.4
South Coast AQMD Air Quality Significance Thresholds	75	100	550	150	150	55
Significant? (YES/NO)	NO	YES	NO	NO	NO	NO

Because the analysis Final Program EIR for the 2016 AQMP concluded that the construction air quality were significant, feasible mitigation measures AQ-1 to AQ-23 for reducing impacts related to construction were adopted, and these mitigation measures are applicable to Control Measure MOB-02, upon which PR 2306 relies (see pp. 4.1-54 to 4.1-56 of the Final Program EIR for the 2016 AQMP). Even after mitigation measures AQ-1 to AQ-23 were applied, the Final Program EIR for the 2016 AQMP concluded that construction air quality impacts would remain significant.

***Mitigation Measures Adopted in the Final Program EIRs for the 2022 AQMP and 2016 AQMP for Construction Air Quality<sup>98</sup>***

Mitigation measures AQ-1 to AQ-26 of the Final Program EIR for the 2022 AQMP and mitigation measures AQ-1 to AQ-23 of the Final Program EIR for the 2016 AQMP are presented side-by-side in Table A-7. Because the analysis conducted in the Final Program EIR for the 2022 AQMP reflects the most recent best practices, owners and operators of equipment required to mitigate air quality impacts from construction are recommended to utilize the mitigation measures of the Final

<sup>98</sup> See Section 4.2.5.1 Criteria Pollutants – Construction Activities of the Final Program EIR for the 2022 AQMP and Section 4.7.1 Mitigation Measures of the Final Program EIR for the 2016 AQMP

Program EIR for the 2022 AQMP in the event of a conflict between mitigation measures that would apply in a given situation.

**Table A-7. Mitigation Measures Adopted in the Final Program EIRs for the 2022 AQMP and 2016 AQMP for Construction Air Quality**

2022 AQMP	2016 AQMP
<p><b>AQ-1</b> Develop a Construction Emission Management Plan to minimize emissions from vehicles including, but not limited to: consolidating truck deliveries so as to minimize the number of trucks on a peak day; scheduling deliveries to avoid peak hour traffic conditions; describing truck routing; describing deliveries including logging delivery times; describing entry/exit points; identifying locations of parking; identifying construction schedule; and prohibiting truck idling in excess of five consecutive minutes or another time-frame as allowed by the California Code of Regulations, Title 13 Section 2485 – CARB’s Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling. The Construction Emission Management Plan shall be submitted to South Coast AQMD – PRDI/CEQA for approval prior to the start of construction. At a minimum, the Construction Emission Management Plan would include the following types of mitigation measures and Best Management Practices.</p> <p><b>AQ-2</b> Tune and maintain all construction equipment to be in compliance with the manufacturer’s recommended maintenance schedule and specifications that optimize emissions without nullifying engine warranties. All maintenance records for each equipment and their construction contractor(s) shall be made available for inspection and remain onsite for a period of at least two years from completion of construction.</p>	<p><b>AQ-1</b> During construction, require the use of 2010 and newer diesel haul trucks (e.g., material delivery trucks and soil import/export). If the Lead Agency determines that 2010 model year or newer diesel trucks cannot be obtained, the Lead Agency shall instead require the use of trucks that meet EPA 2007 model year NOx emissions requirements.</p> <p><b>AQ-2</b> Require all on-site construction equipment to meet the following:</p> <ul style="list-style-type: none"> <li>- All off-road diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.</li> <li>- A copy of each unit’s certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.</li> <li>- Encourage construction contractors to apply for SCAQMD “SOON” funding incentives. The “SOON” program provides funds to accelerate the cleanup of off-road diesel vehicles, such as heavy-duty construction equipment. More information on this program can be found at the following website:</li> </ul>

**Table A-7. Mitigation Measures Adopted in the Final Program EIRs for the 2022 AQMP and 2016 AQMP for Construction Air Quality**

2022 AQMP	2016 AQMP
<p><b>AQ-3</b> Survey and document the construction areas and identify all construction areas that are served by electricity. Onsite electricity, rather than temporary power generators, shall be used in all construction areas that are demonstrated to be served by electricity. This documentation shall be provided as part of the Construction Emissions Management Plan.</p> <p><b>AQ-4</b> Require the use of electric or alternative-fueled (i.e., renewable combustion fuels and hydrogen) construction equipment, if available, including but not limited to, concrete/industrial saws, pumps, aerial lifts, material hoist, air compressors, forklifts, excavator, wheel loader, and soil compactors.</p> <p><b>AQ-5</b> Require all off-road diesel-powered construction equipment rated greater than 50 hp to meet Tier-4 off-road emission standards at a minimum. In addition, if not already supplied with a factory-equipped diesel particulate filter, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations. Construction equipment shall incorporate, where feasible, emissions-reducing technology such as hybrid drives and specific fuel economy standards. In the event that any equipment required under this mitigation measure is not available, the project</p>	<p><a href="http://www.aqmd.gov/tao/Implementation/SOONProgram.htm">http://www.aqmd.gov/tao/Implementation/SOONProgram.htm</a>.</p> <p><b>AQ-3</b> Prohibit vehicles and construction equipment from idling longer than five minutes at the construction site by including these restrictions in the construction company contract(s) and by posting signs on-site, unless the exceptions in the CARB regulations which pertain to idling requirements are applicable.</p> <p><b>AQ-4</b> All on-road heavy-duty diesel trucks or equipment with a gross vehicle weight rating (GVWR) of 19,500 pounds or greater shall comply with EPA 2007 on-road emission standards for PM and NOx (0.01 gram per brake horsepower – hour (g/bhp-hr) and at least 0.2 g/bhp-hr, respectively).</p> <p><b>AQ-5</b> Maintain construction equipment tuned up and with two to four-degree retard diesel engine timing or tuned to manufacturer’s recommended specifications that optimize emissions without nullifying engine warranties.</p> <p><b>AQ-6</b> The project proponent shall survey and document the proposed project’s construction areas and identify all construction areas that are served by electricity. Onsite electricity, rather than temporary power generators, shall be used in all construction areas that are demonstrated to be served by electricity.</p> <p><b>AQ-7</b> Provide temporary traffic controls such as a flag person, during all phases of significant construction activity to maintain smooth traffic flow.</p>

**Table A-7. Mitigation Measures Adopted in the Final Program EIRs for the 2022 AQMP and 2016 AQMP for Construction Air Quality**

2022 AQMP	2016 AQMP
<p>proponent shall provide documentation in the Construction Emissions Management Plan or associated subsequent status reports as information becomes available.</p> <p><b>AQ-6</b> Require the use of zero-emission (ZE) or near-zero emission (NZE) on-road haul trucks such as heavy-duty trucks with natural gas engines that meet CARB’S adopted optional NO<sub>x</sub> emissions standard.</p> <p><b>AQ-7</b> Provide electric vehicle (EV) charging stations or at a minimum, provide the electrical infrastructure and electrical panels which shall be appropriately sized. Electrical hookups should be provided for trucks to plug in any onboard auxiliary equipment.</p> <p><b>AQ-8</b> Provide temporary traffic controls such as a flag person, during all phases of significant construction activity to maintain smooth traffic flow, where necessary.</p> <p><b>AQ-9</b> Provide dedicated turn lanes for the movement of construction trucks and equipment on- and off-site, where applicable.</p> <p><b>AQ-10</b> Clearly identify truck routes with trailblazer signs to guide and ensure that the route shall avoid congested streets and sensitive land uses (e.g., residences, schools, day care centers, etc.), where applicable.</p>	<p><b>AQ-8</b> Provide dedicated turn lanes for the movement of construction trucks and equipment on- and off-site.</p> <p><b>AQ-9</b> Re-route construction trucks away from congested streets or sensitive receptor areas.</p> <p><b>AQ-10</b> Improve traffic flow by signal synchronization.</p> <p><b>AQ-11</b> Reduce traffic speeds on all unpaved roads to 15 mph or less.</p> <p><b>AQ-12</b> Prohibit truck idling in excess of five minutes, on- and off-site.</p> <p><b>AQ-13</b> Schedule construction activities that affect traffic flow on the arterial system to off-peak hours to the extent practicable.</p> <p><b>AQ-14</b> Suspend all excavating and grading operations when wind speeds (as instantaneous gusts) exceed 25 mph.</p> <p><b>AQ-15</b> Suspend all construction activities that generate air pollutant emissions during first stage Smog alerts.</p> <p><b>AQ-16</b> Configure construction parking to minimize traffic interference.</p> <p><b>AQ-17</b> Use alternative clean fueled off-road equipment or give extra points in the bidding process for contractors committing to use such equipment.</p> <p><b>AQ-18</b> Require covering of all trucks hauling dirt, sand, soil, or other loose materials.</p>

**Table A-7. Mitigation Measures Adopted in the Final Program EIRs for the 2022 AQMP and 2016 AQMP for Construction Air Quality**

2022 AQMP	2016 AQMP
<p><b>AQ-11</b> Improve traffic flow by signal synchronization, where applicable and ensure that check-in point for trucks is inside the project site.</p> <p><b>AQ-12</b> Ensure that vehicle traffic inside the project site is as far away as feasible from sensitive receptors.</p> <p><b>AQ-13</b> Restrict overnight truck parking in sensitive land uses by providing overnight truck parking inside the project site.</p> <p><b>AQ-14</b> Design the project such that truck entrances and exits are not facing sensitive receptors and trucks will not travel past sensitive land uses to enter or leave the project site.</p> <p><b>AQ-15</b> Reduce traffic speeds on all unpaved roads to 15 miles per hour (mph) or less.</p> <p><b>AQ-16</b> Prohibit truck idling in excess of five minutes, on- and off-site.</p> <p><b>AQ-17</b> Schedule construction activities that affect traffic flow on the arterial system to off-peak hours to the extent practicable.</p> <p><b>AQ-18</b> Suspend all excavating and grading operations when wind speeds (as instantaneous gusts) exceed 25 mph.</p> <p><b>AQ-19</b> Suspend use of all construction activities that generate air pollutant emissions during first stage smog alerts.</p> <p><b>AQ-20</b> Configure construction parking to minimize traffic interference.</p>	<p><b>AQ-19</b> Install wheel washers where vehicles enter and exit the construction site onto paved roads or wash off trucks and any equipment leaving the site for each trip.</p> <p><b>AQ-20</b> Apply non-toxic soil stabilizers according to manufacturers’ specifications to all inactive construction areas (previously graded areas inactive for ten days or more).</p> <p><b>AQ-21</b> Replace ground cover in disturbed areas as quickly as possible to minimize dust.</p> <p><b>AQ-22</b> Pave road and road shoulders.</p> <p><b>AQ-23</b> Sweep streets at the end of the day with SCAQMD Rule 1186 and 1186.1 compliant sweepers if visible soil is carried</p>

**Table A-7. Mitigation Measures Adopted in the Final Program EIRs for the 2022 AQMP and 2016 AQMP for Construction Air Quality**

2022 AQMP	2016 AQMP
<p><b>AQ-21</b> Require covering of all trucks hauling dirt, sand, soil, or other loose materials.</p> <p><b>AQ-22</b> Install wheel washers where vehicles enter and exit the construction site onto paved roads or wash off trucks and any equipment leaving the site for each trip.</p> <p><b>AQ-23</b> Apply non-toxic soil stabilizers according to manufacturers’ specifications to all inactive construction areas (previously graded areas inactive for ten days or more).</p> <p><b>AQ-24</b> Replace ground cover in disturbed areas as quickly as possible to minimize dust.</p> <p><b>AQ-25</b> Pave road and road shoulders, where applicable.</p> <p><b>AQ-26</b> Sweep streets at the end of the day with sweepers compliant with South Coast AQMD Rules 1186 and 1186.1 if visible soil is carried onto adjacent public paved roads (recommend water sweepers that utilize reclaimed water).</p>	

### *Cumulative Impacts*<sup>99</sup>

The Final Program EIR for the 2022 AQMP concluded that implementation of the 2022 AQMP control measures could result in significant adverse air quality impacts during construction because it is foreseeable and likely that on any given day, construction activities associated with one or more new or existing air pollution control devices overlapping with other types of construction activities associated with producing alternative fuels in order to comply with the 2022 AQMP could occur at more than one facility, and based on the size of any single project, or if more than one facility were concurrently constructed on any given day, the emissions would exceed the South Coast AQMD's air quality significance thresholds. When combined with past, present, and reasonably foreseeable activities, in particular with transportation projects projected in the Southern California Association of Governments (SCAG) Connect SoCal Plan<sup>100</sup> and the CARB 2022 State SIP Strategy<sup>101</sup>, the 2022 AQMP would contribute to cumulatively considerable impacts to air quality related to criteria pollutant emissions during construction, a significant, unavoidable cumulative impact. No additional mitigation measures to reduce the significant cumulative impacts to air quality from construction were identified. Cumulative impacts to air quality from construction for past, present, and reasonably foreseeable future projects would remain significant and unavoidable.

The Final Program EIR for 2016 AQMP concluded that implementation of the 2016 AQMP control measures would result in significant adverse air quality impacts during construction because it is foreseeable and likely that on any given day, construction of one or more control devices in order to comply with the 2016 AQMP could occur at more than one facility, and if more than four facilities or more than four control devices were concurrently constructed on any given day, the emissions would exceed the South Coast AQMD's air quality significance thresholds. The 2016 AQMP control measures would result in significant adverse air quality impacts during construction and, when combined with past, present, and reasonably foreseeable activities, and in particular with transportation projects projected in the 2016 Regional Transportation Plan/Sustainable Communities Strategy (2016 RTP/SCS)<sup>102</sup>, would contribute to cumulatively considerable impacts to air quality impacts during construction identified in the 2016 RTP/SCS, therefore resulting in a significant cumulative impact. No additional mitigation measures to reduce the significant cumulative impacts to air quality impacts during construction were identified. Cumulative impacts to air quality impacts during construction from implementation of the 2016 AQMP would remain significant and unavoidable.

*Summary of Construction Air Quality Analyses*

Table A-8 presents a summary of the construction air quality analyses conducted in the Final Program EIRs for the 2022 AQMP and 2016 AQMP.

**Table A-8. Summary of Air Quality from Construction Analyses in the Final Program EIRs for the 2022 AQMP and 2016 AQMP**

Significance Criteria	Potentially Significant Impacts	Adopted Mitigation Measures	Cumulative Impacts
<p>Air Quality impacts are significant if any of the following conditions occur:</p> <ul style="list-style-type: none"> <li>• A project and/or projects that exceed(s) significance threshold identified by the lead agency.</li> </ul> <hr/> <ul style="list-style-type: none"> <li>- <i>Air Quality impacts are considered significant under specific conditions.</i></li> <li>- <i>Significance is determined by exceeding identified quantitative, qualitative, or performance thresholds for environmental effects.</i></li> <li>- <i>Projects that have emissions less than these thresholds are typically deemed less than significant.</i></li> <li>- <i>The evaluation of air quality and GHG emissions impact compares estimated emissions to air quality significance thresholds in Table A-5.</i></li> </ul>	<p>Implementation of Control Measures MOB-02A and MOB-02B of 2022 AQMP and Control Measure MOB-02 of 2016 AQMP would cause potentially significant air quality impacts from:</p> <ul style="list-style-type: none"> <li>• Construction of infrastructure for zero-emission technologies and electricity, and support for new cleaner equipment or vehicles,</li> <li>• Increase in electricity demand due to increased usage of zero-emission technologies installed at the rail yards,</li> <li>• Installation of air pollution devices at the rail yards, and</li> <li>• Increase in natural gas demand to produce electricity</li> </ul>	<ul style="list-style-type: none"> <li>• AQ-1 to AQ-26 of the Final Program EIR for the 2022 AQMP; and</li> <li>• AQ-1 to AQ-23 of the Final Program EIR for the 2016 AQMP</li> </ul>	<p>Cumulative impacts to air quality for past, present, and reasonably foreseeable future projects would remain significant and unavoidable for criteria pollutant emissions during construction.</p>

## Energy

Both the Final Program EIR for the 2022 AQMP and the Final Program EIR for the 2016 AQMP identified the following physical changes associated with implementation of Control Measures MOB-02A and MOB-02B of 2022 AQMP and Control Measure MOB-02 of 2016 AQMP, upon which PR 2306 relies, to cause potential adverse energy impacts: 1) increase in electricity demand due to increased usage of zero-emission technologies, 2) increase in natural gas demand to produce electricity, and 3) increased production and use of alternative fuels (e.g. hydrogen).

### Significance Criteria

Energy impacts are significant if any of the following conditions occur:

- The project conflicts with adopted energy conservation plans or standards.
- The project results in substantial depletion of existing energy resource supplies.
- An increase in demand for utilities impacts the current capacities of the electric and natural gas utilities.
- The project uses non-renewable energy resources in a wasteful and/or inefficient manner.

### Energy Impacts from Electricity Demand<sup>103</sup>

The Final Program EIR for the 2022 AQMP analyzed potential increases in electricity demand according to the types of sources, and Control Measures MOB-02A and MOB-02B, which seek to identify actions that will result in additional emission reductions at rail yards and intermodal facilities, were grouped with other mobile sources. Table A-9 is a subset of Table 4.3-3 Potential Electricity Use for Mobile Sources Relying on Incentive Programs, from the Final Program EIR for the 2022 AQMP, and illustrates that the vehicles affected by Control Measures MOB-02A and MOB-02B contribute to an estimated increase of Basin-wide annual electricity use by approximately 160.5 gigawatt-hours (GWh) per year.

**Table A-9. Potential Electricity Use for Mobile Sources Relying on Incentive Programs Related to Control Measures MOB-02A and MOB-02B**

Mobile Source Sector	Project Type	Affected Population	Electricity Rate	Potential Electricity Use (GWh/year)
Heavy-Duty Vehicles	Replacement	8,214	1 kWh/mile at 16,600 miles/year	136.4
Off-Road Construction	Repower	656	1 kWh/mile at 16,600 miles/year	10.9
Off-Road Construction	Replacement	365	1 kWh/mile at 16,600 miles/year	6.1
Other Off-Road and CHE	Replacement	428	1 kWh/mile at 16,600 miles/year	7.1
<b>Total</b>				<b>160.5</b>

Key: kWh = kilowatt-hour; GWh = gigawatt-hour

The Final Program EIR for the 2022 AQMP considered Basin-wide electricity use as a basis for analyzing the potential energy impacts due to electricity demand. Statewide electricity consumption was more than 279,000 GWh in 2020, with approximately 118,200 GWh (42 percent) in the South Coast Air Basin. [California Energy Commission (CEC), 2021]. CEC estimated an

<sup>103</sup> See Section 4.3.3.2 Electricity of the Final Program EIR for the 2022 AQMP and Section 4.2.4.1 Electricity of the Final Program EIR for the 2016 AQMP

increase in electricity demand of about 1.6 percent annually through 2035. [CEC, 2021]. By applying that growth rate, the total electricity use in California would be approximately 354,000 GWh by 2035. Approximately 150,000 GWh (42 percent) of that would be within the South Coast Air Basin (assuming the percentage attributed to the South Coast Air Basin remains the same). The 2022 AQMP control measures would then increase the electricity demand by an additional estimated 13,429 GWh (approximately 11 percent over 2020 consumption and nine percent over the CEC projected growth) and this amount does not take into account the electricity that may be needed to operate additional air pollution control equipment or to convert combustion equipment to fully electric. Thus, the overall potential increase in electricity demand could be higher.

In order for utilities to be able to provide sufficient electricity to meet future demands, the use of additional energy storage systems (e.g., battery arrays) is also a key component for being able to store electricity at the time when resources are available (e.g., when the sun shines and the wind blows), and to use that stored electricity at a later time. Further, the analysis in the Final Program EIR for the 2022 AQMP conservatively assumed that all sources affected by a control measure with the potential to increase demand for electricity, would use electricity rather than other forms of energy. In addition, any increase in electricity demand would likely result in a concurrent reduction in demand for other types of fuels, particularly petroleum fuels. Because the control measures in the 2022 AQMP were developed with the goal of attaining the federal ozone standard, the successful implementation of some of the control measures relied on the use of electricity in order to reduce NOx emissions, an overall air quality benefit for the region. Therefore, the 2022 AQMP was expected to result in a substantial depletion of existing energy (specifically electricity) resource supplies.

Even with energy conservation programs in effect in California, additional electricity would be needed, and power plants would be required to supply the projected increase in electricity demand and general population growth. While increased demand for electricity would occur due to general population growth, additional increases in electricity demand beyond general population growth would be expected if all of the control measures in the 2022 AQMP were implemented. The implementation of all the control measures was expected to result in an overall increase of greater than the approximately 11 percent of the existing electricity use for residential, commercial, and mobile sources. This increase, along with the increases in electricity associated with other state programs and mandates, was expected to exceed the electrical generating capacity of the system. Thus, the electricity demand impacts from implementing the 2022 AQMP were concluded in the Final Program EIR to be significant.

Because the energy impacts from implementing the 2022 AQMP were expected to be significant for electricity demand, feasible mitigation measures E-1 to E-12 for reducing impacts related to potential electricity demand were adopted in the Final Program EIR for the 2022 AQMP (see pp. 4.3-21 to 4.3-22 of the Final Program EIR for the 2022 AQMP). Even after mitigation measures E-1 to E-12 were applied, electricity demand impacts would remain significant.

The Final Program EIR for the 2016 AQMP similarly anticipated that the mobile source control measures in the 2016 AQMP would increase the electricity demand in the Basin, and the analysis relied on Basin-wide electricity use to evaluate the potential energy impacts from electricity demand. The anticipated shift of cars, trucks, off-road vehicles, and marine vessels from gasoline and diesel fuels to electricity was projected to create an additional electrical load demand.

At the time of developing the 2016 AQMP, the estimated baseline electricity use in 2014 (the baseline year relied upon for the analysis) in Los Angeles, Orange, Riverside, and San Bernardino counties was about 120,960 GWh [CEC, 2016h, see Table 3.3-1 of the Final Program EIR for the 2016 AQMP] The Final Program EIR for the 2016 AQMP concluded that the amount of electricity that would be needed to charge vehicles represented a relatively small portion of the overall electricity used (about 1 percent) in the four counties. At the time, the CEC estimated an increase in electricity demand of about 1 to 1.3 percent per year through 2026 [CEC, 2016k]. Based on that growth rate, the total projected electricity use was projected to be approximately 135,475 to 140,000 GWh by 2024 and approximately 141,532 to 147,692 GWh by 2031. As explained earlier in this section, a similar analysis and calculations which relied on more recent baseline data and growth factors were conducted in the Final Program EIR for the 2022 AQMP and those estimates supersede the estimates contained in the Final Program EIR for the 2016 AQMP.

Relative to the existing electricity use and the projected future peak electricity demand, implementation of all the control measures was expected to result in an overall increase of 7.86 percent of the existing electricity use by 2024 and 12.7 percent of the existing electricity use by 2031. While these projected increases were expected to be within the electric generating capacity of the region at the time the analysis of the 2016 AQMP was conducted, an increase in electricity of one percent or greater is considered to exceed the South Coast AQMD's energy significance threshold. Further, there was potential for electrical requirements for other control measures for which the electrical demand could not be estimated at the time of the 2016 AQMP. Thus, the energy impacts resulting from potential increases in electricity demand as part of implementing the 2016 AQMP were concluded to be significant.

The peak daily demands for increased electricity associated with further electrification of mobile sources and the energy impacts could be minimized by charging electric vehicles or other equipment at night when the electricity demand is low. Further, the analysis assumed that all sources affected by a control measure with the potential to increase the demand for electricity and would use electricity rather than substituting other types of energy. In addition, any increase in electricity demand would likely result in a concurrent reduction in demand for other types of fuels, particularly petroleum-based fuels. The 2016 AQMP was not expected to result in the use of large amounts of fuel or energy resources or result in the use of fuel or energy resources in a wasteful manner. However, the 2016 AQMP included incentives to shift from using diesel and gasoline fuels to increasing the electrification of stationary and mobile sources. Depending on the location and the amount of energy needed, the electricity portions of existing energy conservation plans that have been adopted by facilities would need to be updated. Therefore, the 2016 AQMP was determined to potentially conflict with existing adopted energy conservation plans. Because the 2016 AQMP could result in a substantial increase in electricity demand at a level greater than one percent of the existing electricity use in the Basin, the projected increases to electricity demand were concluded to be potentially significant.

Because the electricity demand impacts from implementing the 2016 AQMP were concluded to be significant, feasible mitigation measures E-1 to E-7 for reducing these impacts were adopted in the Final Program EIR for the 2016 AQMP (see page 4.2-24 of the Final Program EIR for the 2016 AQMP). Even after mitigation measures E-1 to E-7 were applied, the electricity demand impacts would remain significant.

### *Energy Impacts from Natural Gas Demand*<sup>104</sup>

Control measures in the 2022 AQMP were expected to result in an increase in demand for natural gas primarily associated with the production of electricity in the short term. While the electrical grid needs to generate electricity that is comprised of 100 percent renewable energy by 2045 per Senate Bill 100 (SB 100, De León)<sup>105</sup> (and short-term natural gas usage for the production of electricity will cease), additional sources of electricity would be required in order to meet the 2035 goals of the 2022 AQMP.

There are critical interdependencies between electricity and the natural gas system reliability in California. Natural gas-fired electricity generation has been an integral part of the electricity system, providing baseload power. It has also served as the backstop during drought conditions that reduce the availability of hydroelectric power generation. The role of natural gas-fired electricity generation in the electricity system is shifting with the addition of large amounts of renewable generation, primarily solar and wind. The large influx of renewable energy on the grid has reduced natural gas produced electricity from 53 percent of total electric generation in 2010 to 48 percent in 2020. Renewables have displaced a portion of daytime generation previously provided by natural gas, but the intermittency of solar and wind resources necessitates flexible resources that can quickly come on-line when the sun sets, or winds stop blowing. [CEC, 2021].

Some of the control measures in the 2022 AQMP may result in an increase in the use of natural gas in medium- and heavy-duty on road vehicles. Expanded use of alternative fuels in medium-duty and heavy-duty trucks using more efficient, advanced natural gas engine technologies would be expected to reduce the use of diesel fuel. Natural gas-fired medium- and heavy-duty vehicles are an attractive option to diesel-fueled vehicles because they emit fewer criteria pollutants and toxic components without emitting diesel PM.

Ultimately, as natural gas is and continues to be generally widely available, natural gas supplies are not expected to be limited as a result of implementing the 2022 AQMP. The combined increase in natural gas demand needed for producing electricity and hydrogen and for fueling vehicles could be somewhat offset over the long-term by a decrease in demand for natural gas appliances in commercial and residential setting. However, over the short-term, the natural gas demand is expected to increase. Based upon these considerations, significant adverse energy impacts relating to natural gas demand were expected from implementing the 2022 AQMP.

Because the natural gas demand impacts from implementing the 2022 AQMP were concluded to be significant, feasible mitigation measures E-8 to E-9 for reducing these impacts were adopted in the Final Program EIR for the 2022 AQMP (see page 4.3-26 of the Final Program EIR for the 2022 AQMP). Even after mitigation measures E-8 and E-9 were applied, natural gas demand impacts would remain significant.

The Final Program EIR for the 2016 AQMP similarly projected that the control measures in the 2016 AQMP would increase the natural gas demand in the Basin. Specifically, the mobile source control measures were seen as having the potential for encouraging the use of natural gas as a fuel to offset the use of petroleum fuels while the projected increased demand for electricity would

---

<sup>104</sup> See Section 4.3.3.3 Natural Gas of the Final Program EIR for the 2022 AQMP and Section 4.2.4.2 Natural Gas of the Final Program EIR for the 2016 AQMP

<sup>105</sup> Senate Bill 100, [https://leginfo.legislature.ca.gov/faces/billTextClient.xhtml?bill\\_id=201720180SB100](https://leginfo.legislature.ca.gov/faces/billTextClient.xhtml?bill_id=201720180SB100).

also require additional natural gas since most of the power plants in California generate electricity from equipment that uses natural gas. However, the Final Program EIR for the 2016 AQMP noted that natural gas supplies were abundant as a result of technological innovations, and the natural gas outlook, which in 2007 predicted that 700 trillion cubic feet of natural gas would be economically recoverable, was increased to nearly 1,400 trillion cubic feet of natural gas, a 100 percent increase [CEC, 2013]. Therefore, the Final Program EIR for the 2016 AQMP concluded that implementation of the 2016 AQMP would have a less than significant impact to energy from natural gas demand. Because the natural gas demand impacts were concluded to be less than significant, mitigation measures were not required or adopted.

### *Energy Impacts from Hydrogen Demand*<sup>106</sup>

Both the Final Program EIRs for the 2022 AQMP and 2016 AQMP considered a Basin-wide shift from conventional petroleum fuels to alternative fuels: electricity, natural gas, biodiesel and renewable diesel, ethanol and ethanol blends, hydrogen, propane, methanol, and renewable energy. While PR 2306 does not specify or require particular alternative fuels to be used, electricity and hydrogen are expected to be the primary choices for zero emission options. The topic of electricity was previously discussed in this Appendix, so the following section summarizes the analysis conducted in the Final Program EIRs for the 2022 AQMP and 2016 AQMP relative to hydrogen.

There is growing interest and financial support for the use of hydrogen-powered fuel cells to power cars, trucks, homes, and businesses. As opposed to alternative fuel vehicles which burn fuel in a combustion engine to produce usable energy, a hydrogen fuel cell electric vehicle (FCEV) relies on an electrochemical reaction between hydrogen (from the fuel tank) and oxygen to produce useful electrical energy along with water and heat as waste products. Current hydrogen vehicles in California consist of demonstration fuel cell passenger cars, internal combustion engine passenger cars, fuel cell buses, and hybrid fuel cell buses. Despite continuing improvements in performance and fuel cell system durability, challenges remain for broad commercialization of FCEV technology. These include system integration and optimization, and access to and price of hydrogen fuel (a big hurdle to the use of fuel cell vehicle adoption). [CEC, 2021].

The deployment of both FCEVs and the associated hydrogen fueling infrastructure is mainly for commercial applications in California, with a growing commercial deployment. As such, hydrogen fueling for transportation vehicles is not widely offered for retail sale. Executive Order B-48-18 requires the development of 200 hydrogen stations in California by 2025.<sup>107</sup> At the time the 2022 AQMP was developed, there were 55 public and private hydrogen fueling stations operating in the United States and only 10 of these offered public fueling. There were 23 hydrogen fueling stations operating in California, with nine accessible to the public. However, there are ongoing CEC-funded projects which increased the total number of publicly available hydrogen stations in California to 54 which will help support the deployment of FCEVs in urban retail markets. CEC expects that hydrogen infrastructure will first be deployed in a few select urban markets, and then phased into a wider set of strategic urban areas before it is expanded into a nationwide network. [CEC, 2021c]. The California Fuel Cell Partnership provides an on-line hydrogen fuel station map

---

<sup>106</sup> See Section 4.3.3.5.4 Hydrogen of the Final Program EIR for the 2022 AQMP and Section 4.2.4.4.3 Hydrogen of the Final Program EIR for the 2016 AQMP

<sup>107</sup> Executive Order B-48-18, <https://www.library.ca.gov/wp-content/uploads/GovernmentPublications/executive-order-proclamation/39-B-48-18.pdf>

(<https://cafcp.org/stationmap>) which shows the status of fueling locations as open, off-line, under construction, in-process for permitting, or planned. Data from the CEC’s website currently show that 30 publicly available hydrogen fueling stations are open in the South Coast Air Basin with 18 in Los Angeles County, 11 in Orange County, one in Riverside County and none in San Bernardino County.<sup>108</sup> However, data pertaining to the amount of hydrogen available at each location is not available. Hydrogen suppliers are expected to include major oil companies that currently provide gasoline fuel to retail stations, many of which also operate hydrogen plants to produce hydrogen as a transportation fuel. However, existing hydrogen plants currently operate at full capacity, largely to produce petroleum fuels. Therefore, additional hydrogen would need to be produced to support the use of hydrogen as an alternative fuel.

One goal of the 2022 AQMP was to shift from conventional petroleum fuels to low NOx or zero emission technologies, including hydrogen. The 2022 AQMP does not mandate hydrogen fuel use by fleet operators, and further technology demonstration and deployment of hydrogen vehicles larger than passenger cars (i.e., medium- and heavy-duty vehicles) is still needed. The hybrid and electric vehicle technologies and deployment are much further developed than the hydrogen fuel cell vehicles for industrial and commercial uses (i.e., heavy-duty truck uses). Therefore, early advancement of light-duty FCEVs along with the further development of heavy-duty FCEVs is expected to increase hydrogen demand for mobile sources. Little excess capacity is available to meet the increase in hydrogen demand and additional production facilities will be necessary. Thus, the increased demand for hydrogen fuel was concluded to have significant impacts.

Because the hydrogen demand impacts from implementing the 2022 AQMP were concluded to be significant, the Final Program EIR for the 2022 AQMP adopted feasible mitigation measures E-10 to E-12 for reducing energy impacts related to hydrogen demand (see page 4.3-33 of the Final Program EIR for the 2022 AQMP). Even after mitigation measures E-10 to E-12 are applied, the hydrogen demand impacts would remain significant.

The Final Program EIR for the 2016 AQMP similarly analyzed the growing interest and support for the use of hydrogen-powered fuel cells. However, at the time of adoption of the 2016 AQMP, the development and market deployment of hybrid and electric vehicles was much further along than for hydrogen fuel cell vehicles such that projected hydrogen demand was not expected to require additional hydrogen capacity. Therefore, the Final Program EIR for the 2016 AQMP concluded that implementation of the 2016 AQMP would have less than significant energy impacts relative to hydrogen demand. Since the hydrogen demand impacts were concluded to be less than significant, mitigation measures were not required or adopted.

#### *Mitigation Measures Adopted in the Final Program EIRs for the 2022 AQMP and 2016 AQMP for Energy Impacts*<sup>109</sup>

Mitigation measures E-1 to E-12 of the Final Program EIR for the 2022 AQMP and mitigation measures E-1 to E-7 of the Final Program EIR for the 2016 AQMP are presented side-by-side in Table A-10. Because the analysis conducted for the Final Program EIR for the 2022 AQMP reflects

### *Cumulative Impacts*<sup>110</sup>

The Final Program EIR for the 2022 AQMP concluded that implementation of the 2022 AQMP could result in significant adverse electricity consumption impacts because the potential electricity usage increase would exceed baseline electricity consumption by an estimated 11 percent. Significant impacts were also concluded for natural gas and hydrogen demand. When combined with the Connect SoCal Plan, the SIP strategies, state policies, and other past, present, and reasonably foreseeable activities, the analysis in the Final Program EIR concluded that implementation of the 2022 AQMP control measures would result in a significant increase in electricity, natural gas, and hydrogen demand which may not currently be available, and would contribute to cumulatively considerable impacts. No additional mitigation measures to reduce the significant cumulative impacts to energy were identified. Cumulative impacts to energy demand for past, present, and reasonably foreseeable future projects would remain significant and unavoidable for electricity, natural gas, and hydrogen demand.

The Final Program EIR for 2016 AQMP concluded that implementation of the 2016 AQMP control measures would result in significant adverse electricity consumption impacts because the potential electricity usage increase would exceed baseline electricity consumption by 7.8 to 12.7 percent. No significant impacts on natural gas supplies and petroleum fuels associated with the 2016 AQMP were identified because of the anticipated reduction in future demand and wide availability of natural gas. No significant impacts on hydrogen were identified because hydrogen demand was not expected to require additional hydrogen capacity. The 2016 AQMP control measures would result in significant adverse energy demand impacts and, when combined with past, present, and reasonably foreseeable activities, and in particular with transportation projects projected in the 2016 RTP/SCS, would contribute to cumulatively considerable impacts to energy identified in the 2016 RTP/SCS, therefore resulting in a significant cumulative impact. No additional mitigation measures to reduce the significant cumulative impacts to energy were identified. Cumulative impacts to energy from implementation of the 2016 AQMP would remain significant and unavoidable.

### *Summary of Energy Analyses*

Table A-11 presents a summary of the energy analyses conducted in the 2022 AQMP and 2016 AQMP.

---

<sup>110</sup> See Section 4.3.5 Cumulative Energy Impacts and Mitigation Measures of the Final Program EIR for the 2022 AQMP and Section 5.7.1 Cumulative Impacts of the Final Program EIR for the 2016 AQMP

## Hazards and Hazardous Materials

Both the Final Program EIR for the 2022 AQMP and the Final Program EIR for the 2016 AQMP identified the increased use of alternative fuels to be a potentially significant hazards and hazardous materials impact associated with implementation of Control Measures MOB-02A and MOB-02B from the 2022 AQMP and Control Measure MOB-02 from the 2016 AQMP, upon which PR 2306 relies. The Final Program EIR for the 2022 AQMP also identified and analyzed potentially significant hazards and hazardous materials impacts associated with production of hydrogen. While PR 2306 does not specify or require particular alternative fuels to be used, batteries (electricity) and hydrogen are expected to be the primary choices for zero emission options. The following discussion will summarize the analysis conducted for the use of batteries in electric vehicles and hydrogen in the Final Program EIRs for the 2022 AQMP and 2016 AQMP.

### *Significance Criteria*

Hazards and hazardous materials impacts are significant if any of the following conditions occur:

- Non-compliance with any applicable design code or regulation.
- Non-conformance to National Fire Protection Association standards.
- Non-conformance to regulations or generally accepted industry practices related to operating policy and procedures concerning the design, construction, security, leak detection, spill containment, or fire protection.
- Exposure to hazardous chemicals in concentrations equal to or greater than the Emergency Response Planning Guideline (ERPG) 2 levels.

### *Hazards and Hazardous Materials Impacts from Use of Batteries in Electric Vehicles*<sup>111</sup>

The control measures in the 2022 AQMP focus on maximizing the implementation of zero emission and low NOx technologies which are expected to include electrification of mobile sources (light-duty vehicles, medium-duty vehicles, and heavy-duty vehicles). Electric and hybrid vehicles (hybrids) both use electricity as part of their fuel system. Electric vehicles rely purely on electric power stored in batteries. Hybrids also use batteries as part of their fuel supply; however, hybrids supplement their electric demand by using gasoline engines to generate either mechanical or electric power on demand. Since gasoline is a conventional fuel, any difference in hazards associated with hybrid and electric vehicles would be from the batteries.

Battery technologies in electric vehicles have primarily included nickel-metal hydride (NiMH) and lithium ion (Li-ion). Electric vehicles require high-energy batteries (i.e., batteries that store significant quantities of energy, retain it efficiently, and discharge it at a high rate). Li-ion batteries are the most commonly used batteries in electric vehicles because of their high energy density which allows them to store large amounts of energy, low self-discharge rate which allows them to retain a charge, and excellent electrochemical potential which allows high-power discharge). [NTSB, 2020]. Li-ion batteries are also lighter in weight than other battery types used in electric vehicles.

NiMH batteries can generate hydrogen gas if overcharged, which can lead to explosions without proper venting. In 1996, the International Center for Technology Assessment (ICTA) conducted a

---

<sup>111</sup> See Section 4.4.3.2.1 Electric and Hybrid Vehicles of the Final Program EIR for the 2022 AQMP and Section 4.3.4.2.7 Electric/Hybrid of the Final Program EIR for the 2016 AQMP

comprehensive review of the safety concerns associated with the use of electric vehicles. The ICTA found that risk of hydrogen emissions during stressful conditions has been virtually eliminated by the use of seals and proper valve regulation. By following the National Electric Codes (NECs) and the Society of Automotive Engineers (SAE) recommended safety practices and guidelines for the operation and maintenance of electric vehicles and hybrids, any hydrogen gas risk during battery recharging would be eliminated. [ICTA, 1996].

Fires in electric vehicles powered by high-voltage Li-ion pose a risk of electric shock in the event of a damaged Li-ion battery. A further risk is that damaged cells in the battery can experience uncontrolled increases in temperature and pressure (thermal runaway), which can lead to hazards such as battery reignition and fire. The risks of electric shock and battery reignition/fire arise from the stranded energy that remains in a damaged battery and the fires can generate large amounts of acrid smoke. [NTSB, 2020].

In response to fires in electric vehicles, the National Transportation Safety Board (NTSB) performed an investigation on the fire hazards associated with Li-ion batteries in electric vehicles and concluded the following:

1. Manufacturers' emergency response guides provide sufficient vehicle-specific information for disconnecting an electric vehicle's high-voltage system when the high-voltage disconnects are accessible and undamaged by crash forces.
2. Crash damage and resulting fires may prevent first responders from accessing the high-voltage disconnects in electric vehicles.
3. The instructions in most manufacturers' emergency response guides for fighting high-voltage Li-ion battery fires lack vehicle-specific details on suppressing the fires.
4. Thermal runaway and multiple battery reignitions after initial fire suppression are safety risks in high-voltage Li-ion battery fires.
5. The energy remaining in a damaged high-voltage Li-ion battery (stranded energy) poses a risk of electric shock and creates the potential for thermal runaway that can result in battery reignition and fire.
6. High-voltage Li-ion batteries in electric vehicles, when damaged by crash forces or internal battery failure, present special challenges to first and second responders because of insufficient information from manufacturers on procedures for mitigating the risks of stranded energy.
7. Storing an electric vehicle with a damaged high-voltage Li-ion battery inside the recommended 50-foot radius clear area may be infeasible at tow or storage yards.
8. Electric vehicle manufacturers should use the International Organization for Standardization standard 17840 template to present emergency response information.
9. Action by the National Highway Traffic Safety Administration (NHTSA) to incorporate scoring relative to the availability of a manufacturer's emergency response guide and its adherence to the International Organization for Standardization standard 17840 and SAE International recommended practice J2990 into the U.S. New Car Assessment Program, would be an incentive for manufacturers of vehicles sold in the United States with high-voltage Li-ion battery systems to comply with those standards.

10. Although existing standards address damage sustained by high-voltage Li-ion battery systems in survivable crashes, they do not address high-speed, high-severity crashes resulting in damage to high-voltage Li-ion batteries and the associated stranded energy.

Based on their findings, the NTSB made the following recommendations:

1. The NHTSA when determining a vehicle's U.S. New Car Assessment Program score, should factor in the availability of a manufacturer's emergency response guide and its adherence to the International Organization for Standardization standard 17840 and SAE International recommended practice J2990.
2. The NHTSA should convene a coalition of stakeholders to continue research on ways to mitigate or deenergize the stranded energy in high-voltage Li-ion batteries and to reduce the hazards associated with thermal runaway resulting from high-speed, high severity crashes.
3. Electric vehicle manufacturers should model the emergency response guides on International Organization for Standardization standard 17840 (as included in SAE International recommended practice J2990) and incorporate vehicle-specific information on: 1) fighting high-voltage Li-ion battery fires; 2) mitigating thermal runaway and the risk of high-voltage Li-ion battery reignition; 3) mitigating the risks associated with stranded energy in high-voltage Li-ion batteries, both during the initial emergency response and before moving a damaged electric vehicle from the scene; and 4) safely storing an electric vehicle that has a damaged high-voltage Li-ion battery.
4. The National Fire Protection Association (NFPA), the International Association of Fire Chiefs, the International Association of Fire Fighters, the National Alternative Fuels Training Consortium, the National Volunteer Fire Council, and the Towing and Recovery Association of America should inform members about the circumstances of the fire risks described in this report and provide guidance to emergency personnel who respond to high-voltage Li-ion battery fires in electric vehicles.

While electric cars may have fire risks, a recent study shows that they are less likely to cause a vehicle fire than either gas-powered or hybrid vehicles. Data from the NTSB was used to track the number of car fires, and it was compared to sales data from the Bureau of Transportation Statistics. The data showed that for every 100,000 vehicles sold, hybrid-powered vehicles (which use gasoline) were involved in about 3,475 fires and conventional gasoline-powered vehicles were involved in approximately 1,530 fires while electric vehicles were involved in approximately 25 fires. Gasoline-powered vehicles and hybrid vehicles rely on combustion, in whole or in part, respectively, to function, while the electric cars rely on 100 percent electricity. [AutoinsuranceEZ, 2022]. Based on the results from the study, electric vehicles were concluded to not be inherently more dangerous than conventional gasoline-fueled or hybrid vehicles, but electric vehicle fires tend to be more difficult than gasoline fires to extinguish. [AutoinsuranceEZ, 2022].

The likelihood to overheat or ignite is increased if the batteries are poorly packaged, damaged, or exposed to a fire or a heat source. However, when packaged and handled properly, Li-ion batteries

pose a minimal threat to the environment.<sup>112</sup> [DOT, 2014]. As noted in the aforementioned study, internal combustion engines also can result in fires and other hazards; therefore, switching to battery power would not likely result in an increased fire risk. Therefore, the Final Program EIR for the 2022 AQMP concluded that implementation of the 2022 AQMP would have a less than significant impact to hazards and hazardous materials from use of electric vehicles and batteries. Because impacts were concluded to be less than significant, mitigation measures were not required or adopted.

The Final Program EIR for the 2016 AQMP similarly analyzed NiMH and Li-ion as the most common battery technologies used in modern EVs and hybrids. The Final Program EIR noted that there had been in a shift away from nickel metal hydride batteries in EV's to lithium-ion batteries [UN, 2010]. NHTSA performed an investigation on the fire hazards associated with Li-ion batteries in EVs, and concluded that EVs do not pose a greater risk of fire than gasoline-powered vehicles. When Li-ion batteries are being charged, they can generate hydrogen gas that is explosive in certain concentrations, but this hazard exists with lead-acid batteries as well as other types of batteries so the hazards associated with charging Li-ion batteries are expected to be similar to the hazards associated with lead-acid batteries. Overall, the fire hazards associated with an electric vehicle were expected to be less than a conventional vehicle because there would be no leak or spills of petroleum fuel (gas or diesel) that is flammable in the event of an accident. All electrical propulsion vehicles must comply with Federal Motor Vehicle Safety Standard (FMVSS) 305, which specifies performance requirements for limiting electrolyte spillage, retaining propulsion batteries, and electrically isolating the chassis from the high-voltage system during a crash event. FMVSS assures that accidents involving an EV or hybrid would cause no more electrical hazard than a gasoline- or diesel-powered vehicle. Therefore, the Final Program EIR for the 2016 AQMP concluded that implementation of the 2016 AQMP would have a less than significant impact to hazards and hazardous materials from use of electric vehicles and batteries. Because impacts were concluded to be less than significant, mitigation measures were not required or adopted.

#### *Hazards and Hazardous Materials Impacts from Use of Hydrogen*<sup>113</sup>

The physical hazards associated with bulk liquid transport and storage are similar to liquified natural gas (LNG), as they are both cryogenic liquids. The physical hazards associated with distributing hydrogen via pipeline and steam reformer hydrogen stations are similar to CNG as they are both compressed gases. In general, the fire hazards associated with hydrogen spills or leaks are higher than conventional fuels due to the wide flammability range and low ignition energy of hydrogen. However, hydrogen tanks are fabricated according to more rigorous standards than conventional fuel tanks, which helps reduce the likelihood of spills or leaks. The main additional hazard associated with the use of hydrogen versus conventional fuels is the difficulty in being able to recognize a hydrogen fire when it is happening. Hydrogen burns with a pale blue flame that is almost invisible during daylight hours making hydrogen fires are almost impossible to see with the naked eye. Hydrogen fires have low radiant heat, so it may be difficult to sense the presence of a flame until you are very close to it. Thus, the potential of a large fire stemming from

---

<sup>112</sup> Department of Transportation, Pipeline and Hazardous Materials Safety Administration, 2014. 49 CFR Parts 171, 172, 173, et al., Hazardous Materials: Transportation of Lithium Batteries, Federal Register Volume 79, Issue 151 (79 FR pp. 46011-46032).

<sup>113</sup> See Section 4.4.3.2.2 Hydrogen of the Final Program EIR for the 2022 AQMP and Section 4.3.4.2.6 Hydrogen of the Final Program EIR for the 2016 AQMP

a release of hydrogen in the case of an accident (e.g., a tanker truck accident) could pose challenges for fire-fighting personnel. Although hydrogen fires do not produce smoke themselves, burning of nearby combustible materials can result in smoke which help visual clues to a fire. Normally hydrogen fires are not extinguished until the supply of hydrogen has been shut off or exhausted since there is a danger of re-ignition and explosion. Firefighting personnel are trained in the characteristics of hydrogen fires and proper procedures for dealing with them. For the same fire hazard reasons, another potentially significant hazard is the release of hydrogen in an enclosed space (e.g., garage or vehicle maintenance facility).

Compared with diesel fuel and gasoline, the following can be stated about hydrogen:

- Diesel fuel and gasoline are toxic to the skin and lungs while hydrogen is non-toxic and non-reactive, so if released, it does not present a health hazard to humans.
- Diesel fuel and gasoline vapors are heavier than air (for specific gravity of air = 1, diesel fuel is >4.0, gasoline is 3.4) while hydrogen is 14 times lighter than air. If released, hydrogen will quickly rise dissipate into the atmosphere greatly reducing the risk of ignition at ground level.
- Hydrogen has an extremely low ignition energy requirement; about 20 microjoules can ignite hydrogen/air, which is about 10 times less than what is required to ignite a gasoline/air mixture. Gasoline can be explosive at oxygen concentrations between one and three percent while hydrogen can be explosive with oxygen concentrations between 18 and 59 percent. This means that gasoline has greater risk for explosion than hydrogen for any given environment with oxygen. [PNL, 2004].
- Hydrogen has a lower radiant heat when compared to gasoline, meaning the air around the hydrogen flame is not as hot as around a gasoline flame. Therefore, the risk of hydrogen secondary fires is lower.
- Hydrogen is clear, odorless, and tasteless. It burns with an extremely hot, but nonluminous flame which is difficult to see during the day. The flame of burning hydrogen has few warning properties.
- Hydrogen has an unusually large flammability range and can form ignitable mixtures between four and 75 percent by volume in air. Given confinement and good mixing, hydrogen can be detonated over the range of 18 to 59 percent by volume in air.

Based upon the preceding information, hazards associated with hydrogen are approximately equivalent or less when compared to conventional fuels. In addition, fire hazards associated with hydrogen when compared to fires involving conventional fuels are equivalent but will require different firefighting protocols due to the nature of hydrogen. Therefore, both the Final Program EIR for the 2022 AQMP and the Final Program EIR for the 2016 AQMP concluded that no significant increase in hazards would be expected from using hydrogen in mobile sources when compared to conventional fuels. Because impacts were concluded to be less than significant, mitigation measures were not required or adopted.

Use of alternative fuels requires additional knowledge and training of owners/operators of fueling stations regarding maintaining and operating alternative fuel refueling stations and emergency responders. Further, as use of alternative fuels increases within the South Coast AQMD's jurisdiction, use of conventional fuels such as gasoline and diesel will decline. As a result,

explosion and flammability hazards associated with conventional fuels will also decline. In addition, hazards and hazardous clean-up associated with accidental releases of conventional fuels, especially diesel, will be reduced as the use of alternative fuels increases. For the storage and dispensing of alternative fuels, compliance with existing regulations and recommended safety procedures will ensure that any potential hazards impacts associated with alternative clean-fuels are expected to be the same or less than those of conventional fuels. Accordingly, the Final Program EIRs for the 2022 AQMP and 2016 AQMP concluded that the hazards impacts from the increased use of alternative fuels would be similar to or less than hazards associated with conventional fuels, and that no significant increase in hazards would be expected from using alternative fuels in mobile sources when compared to conventional fuels. Because impacts were concluded to be less than significant, mitigation measures were not required or adopted.

### *Hazards and Hazardous Materials Impacts from Production of Hydrogen*<sup>114</sup>

The Final Program EIR for the 2022 AQMP analyzed risk associated with hydrogen production. More than 95 percent of U.S.-produced hydrogen is made in central plants via a steam methane reforming process using natural gas, refinery fuel gas, coal, and water electrolysis. In the early stages, expanded hydrogen production will likely rely on natural gas feedstock, as this approach offers a low-cost pathway to producing hydrogen. Over time, hydrogen fuel production could evolve from this natural gas dominance to a more diversified production mix, such as a lower-carbon production mix that includes natural gas reformation with carbon capture and storage, coal with carbon capture and storage (for hydrogen production outside of California), biofuels, waste resources, nuclear (for hydrogen production outside of California), and water electrolysis using renewable electric power. This shift is anticipated because it is expected that there will be a significant push to de-carbonize transportation fuels. Hydrogen may also be produced from renewable energy resources and waste streams using low-carbon-emitting processes (e.g., biomass gasification, water electrolysis using renewable electricity, and reformation of renewable natural gas)<sup>115</sup>. [CEC, 2021].

A recent hazard analysis was conducted for a proposed new hydrogen plant at a renewable fuels facility in Southern California. The results of the analysis indicated that the worst-case hazard zones associated with an upset of the hydrogen plant and related pipelines were related to a torch fire and would create hazards to surrounding areas within approximately 90 feet of the fire. The rupture of a related natural gas pipeline that would feed the hydrogen plant was also identified as a potential torch fire risk which could create hazards to surrounding areas within approximately 183 feet of a release. Since the construction of any new hydrogen plants would be expected to be constructed within existing industrial facilities that would likely have at least 90 feet to the closest off-site receptor, less than significant impacts would be expected relative to risk associated with hydrogen production. Existing natural gas pipelines provide service to most existing facilities, but the construction of new natural gas pipelines could be significant if located offsite of a facility where a new hydrogen production facility may be located, as the precise location of new natural

---

<sup>114</sup> See Section 4.4.3.2.2 Hydrogen of the Final Program EIR for the 2022 AQMP and Section 4.3.4.2.6 Hydrogen of the Final Program EIR for the 2016 AQMP

<sup>115</sup> CEC, 2021. Final 2021 Integrated Energy Policy Report, Volume II, Ensuring Reliability in a Changing Climate. CEC-101-2021-001-V2 February, 2022. <https://www.energy.ca.gov/data-reports/reports/integrated-energy-policy-report/2021-integrated-energy-policy-report>

gas pipelines cannot be forecasted. Natural gas pipelines are located throughout urban areas, including within residential areas and adjacent to sensitive receptors.

New natural gas pipelines are subject to a number of regulatory requirements, including the following:

- Hydrostatic testing to 125 percent of the operating pressure is required by the state Fire Marshal prior to operation of a pipeline. Additional periodic testing is required for pipelines, with the frequency of testing based on pipeline age, use of cathodic protection, and release history;
- New pipelines are required to accommodate instrumented internal inspection devices (commonly referred to as “smart pigs”). “Smart pigs” detect where corrosion or other damage has affected the wall thickness or shape. Additionally, to ensure the pipeline is operating properly and the total volume of material shipped is received, monitoring of operations during transfer of material is required and may include pressure indicators along the pipeline route, as well as flow meters at both the shipping and receiving ends of the pipeline;
- Cathodic protection is required for new pipelines. Cathodic protection is a technique used to control the corrosion of a metal surface by making it the cathode of an electrochemical cell. Avoiding corrosion protects the integrity of the pipeline and minimizes that potential for releases; therefore, installation of cathodic protection helps to prevent pipeline releases;
- Federal regulations require the installation and maintenance of line marker posts so that the pipeline is easily identifiable. In addition, annual inspections are required to look for corrosion and other issues;
- Pipelines are registered with the USA North 811 underground service alert system. Contractors contact this organization prior to beginning excavation activities. The organization notifies the owners of underground facilities in the area of the proposed construction activities. The owners and contractors can then discuss the proposed construction activities. Owners typically mark the exact location of the pipelines and communicate the locations to the contractors. Participation in the USA system minimizes the potential for damage and meets the requirements of the operator’s damage prevention program pursuant to 49 CFR Part 192 requirements;
- 49 CFR Part 192, Subpart N, requires minimum training requirements for operators of pipeline facilities. These requirements assure that individuals working on the pipeline would have appropriate training and experience;
- The operation of pipelines is required to have an Emergency Response Plan that identifies specific measures that would be implemented in the event of upset conditions. The Emergency Response Plan identifies responsible parties for the incident command and supporting agencies and organizations; and
- New natural gas pipeline may require the installation of safety blowdown equipment at one location along the designated route. The blowdown equipment will allow for the controlled release and dispersion of gas in the pipeline in the event of an upset condition. Blowdown equipment is part of the PHMSA requirements.

These extensive state and federal requirements on new (and existing) natural gas pipelines, are expected to be implemented and enforced. Implementation of these extensive requirements is expected to minimize the severity of potential hazard impacts of natural gas pipeline releases should they occur. As such, no mitigation measures were identified or adopted in the Final Program EIR for the 2022 AQMP that would be capable of reducing impacts beyond the existing state and federal requirements in place for this environmental topic area. The operational impacts associated with the new natural gas pipeline would remain significant as a release could potentially impact receptors, including residences, and would be a new or intensified hazard. Therefore, the Final Program EIR for the 2022 AQMP concluded that hazards associated with the potential increase in transmission of natural gas via pipeline to service hydrogen plants would be potentially significant.

At the time of writing the Final Program EIR for the 2016 AQMP, additional hydrogen production was not expected to be required to meet the projected hydrogen demand. Therefore, hazards and hazardous materials impacts from hydrogen production as a result of implementing control measures such as MOB-02 were not identified.

*Regarding Mitigation Measures for Hazards and Hazardous Materials Impacts in the Final Program EIR for the 2022 AQMP<sup>116</sup>*

The Final Program EIR for the 2022 AQMP concluded that production of hydrogen would result in potentially significant hazards and hazardous materials impacts. More specifically, based on the results of a recent hazards analysis, construction of new natural gas pipelines to service hydrogen production facilities may be a potential torch fire risk which could create hazards to surrounding areas within approximately 183 feet of a release. Because there are extensive state and federal requirements on new and existing natural gas pipelines, and implementation of these requirements are expected to minimize the severity of potential hazard impacts of natural gas pipeline releases should they occur, no mitigation measures were identified or adopted in the Final Program EIR for the 2022 AQMP that would be capable of reducing impacts beyond the existing state and federal requirements in place for this environmental topic area.

*Cumulative Impacts<sup>117</sup>*

The Final Program EIR for the 2022 AQMP concluded that implementation of Control Measures MOB-02A and MOB-02B could result in significant adverse hazards and hazardous materials impacts from the construction of new natural gas pipelines to service hydrogen plants. No mitigation measures were identified for construction of a new natural gas pipeline. When combined with the Connect SoCal Plan, the SIP strategies, state policies, and other past, present, and reasonably foreseeable activities, the 2022 AQMP would result in significant hazards and hazardous materials impacts, and would contribute to cumulatively considerable impacts. No additional mitigation measures to reduce the significant cumulative impacts to hazards and hazardous materials were identified. Therefore, the Final Program EIR concluded that cumulative impacts to hazards and hazardous materials for past, present, and reasonably foreseeable future projects would remain significant and unavoidable.

---

<sup>116</sup> See Section 4.4.5 Cumulative Hazards and Hazardous Materials Impacts and Mitigation Measures of the Final Program EIR for the 2022 AQMP

<sup>117</sup> See Section 4.4.5.3 Summary of Cumulative Hazards and Hazardous Materials Impacts of the Final Program EIR for the 2022 AQMP and Section 5.9.1 Cumulative Impacts of the Final Program EIR for the 2016 AQMP

The Final Program EIR for 2016 AQMP concluded that implementation of Control Measure MOB-02 would not result in significant adverse hazards and hazardous materials impacts. Other 2016 AQMP control measures, however, would result in significant adverse hazards and hazardous materials impacts and, when combined with past, present, and reasonably foreseeable activities, and in particular with transportation projects projected in the 2016 RTP/SCS, would contribute to cumulatively considerable impacts to hazards and hazardous materials identified in the 2016 RTP/SCS, therefore resulting in a significant cumulative impact. No additional mitigation measures to reduce the significant cumulative impacts to hazards and hazardous materials were identified. Cumulative impacts to hazards and hazardous materials from implementation of the 2016 AQMP would remain significant and unavoidable.

*Summary of Hazards and Hazardous Materials Analyses*

Table A-12 presents a summary of the hazards and hazardous materials analyses conducted in the 2022 AQMP and 2016 AQMP.

**Table A-12. Summary of Hazards and Hazardous Materials Analyses in the Final Program EIRs for the 2022 AQMP and 2016 AQMP**

Significance Criteria	Potentially Significant Impacts	Mitigation Measures	Cumulative Impacts
<p>Hazards and hazardous materials impacts are significant if any of the following conditions occur:</p> <ul style="list-style-type: none"> <li>• Non-compliance with any applicable design code or regulation.</li> <li>• Non-conformance to National Fire Protection Association standards.</li> <li>• Non-conformance to regulations or generally accepted industry practices related to operating policy and procedures concerning the design, construction, security, leak detection, spill containment, or fire protection.</li> <li>• Exposure to hazardous chemicals in concentrations equal to or greater than the Emergency Response Planning Guideline (ERPG) 2 levels.</li> </ul>	<p>Implementation of Control Measures MOB-02A and MOB-02B in the 2022 AQMP would cause potentially significant hazards and hazardous materials impacts from:</p> <ul style="list-style-type: none"> <li>• Increased production and use of alternative fuels (e.g., hydrogen).</li> </ul> <p>No potentially significant hazards and hazardous impacts were identified for Control Measure MOB-02 from the 2016 AQMP.</p>	<p>No hazards and hazardous materials mitigation measures were adopted for Control Measures MOB-02A and MOB-02B in the Final Program EIR for the 2022 AQMP.</p> <p>No hazards and hazardous materials mitigation measures were adopted for Control Measures MOB-02 in the Final Program EIR for the 2016 AQMP.</p>	<p>Cumulative impacts to hazards and hazardous demand for past, present, and reasonably foreseeable future projects would remain significant and unavoidable for construction of new natural gas pipelines to service hydrogen plants.</p>

## Noise

Various types of construction activities will be necessary to implement most control measures including Control Measures MOB-02A and MOB-02B of the 2022 AQMP and Control Measure MOB-02 of the 2016 AQMP. The Final Program EIR for the 2022 AQMP evaluated the construction and installation of infrastructure to support the use of additional electricity and alternative fuels from Control Measures MOB-02A and MOB-02B. The Final Program EIR for the 2016 AQMP evaluated construction of infrastructure to provide support for new cleaner equipment or vehicles.

### *Significance Criteria*

Noise impacts are significant if any of the following conditions occur:

- Construction noise levels exceed the local noise ordinances or, if the noise threshold is currently exceeded, project noise sources increase ambient noise levels by more than three decibels (dBA) at the site boundary. Construction noise levels will be considered significant if they exceed federal Occupational Safety and Health Administration (OSHA) noise standards for workers.
- The proposed project operational noise levels exceed any of the local noise ordinances at the site boundary or, if the noise threshold is currently exceeded, project noise sources increase ambient noise levels by more than three dBA at the site boundary.

### *Noise Impacts from Construction*<sup>118</sup>

The Final Program EIR for the 2022 AQMP considered that implementation of Control Measures MOB-02A and MOB-02B would require installing charging and alternative fueling infrastructure for the storage and dispensing of alternative fuels for use in on-road heavy-duty vehicles, off-road equipment, and locomotives operating at new rail yards and intermodal facilities; and deploying the cleanest locomotives, switchers, on-road heavy-duty trucks, cargo-handling equipment, transportation refrigeration units available (see Final Program EIR for the 2022 AQMP, Table 4.6-1). Control Measures MOB-02A and MOB-02B could also require the installation roadway infrastructure within or adjacent to existing roadways, streets, freeways, and/or transportation corridors. For the purpose of evaluating potential noise impacts for these control measures, the analysis in the Final Program EIR for the 2022 AQMP assumed that no new rail or truck traffic routes would be constructed, but that some of the existing routes/corridors could be modified to include roadway infrastructure.

Similarly, the Final Program EIR for the 2016 AQMP considered potential noise impacts associated with Control Measure MOB-02 could include installation of roadway infrastructure (wayside power and catenary lines or other similar technologies), and installation of battery charging or fueling infrastructure. For purposes of evaluating potential noise impacts, it was assumed that no new industrial facilities or corridors would be constructed, but rather some of the existing facilities and corridors would be modified to include installation of new equipment and roadway infrastructure; and no new rail or truck traffic routes would be constructed, but rather

---

<sup>118</sup> See Section 4.6.3.1 Noise Associated with Construction Activities of the Final Program EIR for the 2022 AQMP and Section 4.5.4.1 Construction Activities of the Final Program EIR for the 2016 AQMP

some of these existing routes/corridors would be modified to include catenary overhead electrical lines or magnetic lines.

The existing rail and truck routes/corridors likely to be modified are located primarily in commercial and industrial zones within the Southern California area. Examples of these areas include, but are not limited to, industrial areas in and around container transfer facilities (rail and truck) near the Terminal Island Freeway, along the Alameda Corridor, as well inland rail yards near downtown Los Angeles.

The potential noise impact of construction activities would vary depending on the existing noise levels in the environment and the location of sensitive receptors (e.g., residences, hotels, hospitals, etc.) with respect to construction activities. Because no specific projects were proposed, the noise impacts were determined to be speculative. Potential modifications were assumed to occur at facilities typically located in appropriately zoned industrial or commercial areas, so construction noise impacts at stationary sources on sensitive receptors were concluded to be less than significant. The construction of roadway infrastructure would result in additional construction noise sources near transportation corridors, and it is not uncommon for residences and other sensitive receptors to be located within several hundred feet of the existing roadways, so noise levels associated with construction activities could increase three dBA or greater and generate potentially significant noise impacts, although temporary. Vibration from construction activities could exceed the 72 vibration decibels (VdB) threshold for structures and sensitive receptors within 200 feet of construction activities if certain types of construction equipment are used and so was considered potentially significant in both the Final Program EIR for the 2022 AQMP and the Final Program EIR for the 2016 AQMP. (See Table A-13 which is Table 4.6-5 Representative Construction Equipment Vibration Impacts, from the Final Program EIR for the 2022 AQMP. Table 4.6-5 from the Final Program EIR for the 2022 AQMP presents updated vibration data for the same equipment compared to Table 4.5-4 from the Final Program EIR for the 2016 AQMP.)

**Table A-13. Representative Construction Equipment Vibration Impacts**

Equipment	Peak Particle Velocity (PPV) at 25 ft (inches/sec) <sup>(1)</sup>	Velocity Level (Lv) at 25 ft (VdB) <sup>(1)</sup>	PPV at 200 ft (inches/sec) <sup>(2)</sup>	Lv at 200 ft (VdB) <sup>(3)</sup>
Impact Pile Driver (typical)	0.644	104	0.0285	77
Vibratory Roller	0.210	94	0.0093	67
Large Bulldozers	0.089	87	0.0039	60
Loaded Trucks	0.076	86	0.0034	59
Jackhammer	0.035	79	0.0015	52
Small Bulldozer	0.003	58	0.0001	31

(1) Source: FTA, 2018. Data reflects typical vibration levels

(2) Source: FTA, 2018. Eq. 7-2.

(3)Source: FTA, 2018. Eq. 7-3.

Because the noise impacts from implementing the 2022 AQMP were concluded to be significant for noise and vibration impacts during construction activities, feasible mitigation measures NS-1 to NS-14 for reducing impacts related to noise and vibration were adopted in the Final Program EIR for the 2022 AQMP (see pages 4.6-12 to 4.6-14 of the Final Program EIR for the 2022 AQMP). Even after mitigation measures NS-1 to NS-14 were applied, the Final Program EIR for the 2022 AQMP concluded that the overall noise and vibration impacts during construction activities would remain significant.

Similarly, because the noise impacts from implementing the 2016 AQMP were concluded to be significant for noise and vibration impacts during construction activities, feasible mitigation measures NS-1 to NS-17 for reducing impacts related to noise and vibration were adopted in the Final Program EIR for the 2016 AQMP (see pages 4.5-11 to 4.5-12 of the Final Program EIR for the 2016 AQMP). Even after mitigation measures NS-1 to NS-17 were applied, the Final Program EIR for the 2016 AQMP concluded that the overall noise and vibration impacts during construction activities would remain significant.

*Mitigation Measures Adopted in the Final Program EIRs for the 2022 AQMP and 2016 AQMP for Noise and Vibration Impacts During Construction*<sup>119</sup>

Mitigation measures NS-1 to NS-14 of the Final Program EIR for the 2022 AQMP and mitigation measures NS-1 to NS-17 of the Final Program EIR for the 2016 AQMP are presented side-by-side in Table A-14. Because the analysis conducted in the Final Program EIR for the 2022 AQMP reflects the most recent best practices, owners and operators of equipment required to mitigate noise and vibration impacts from construction are recommended to utilize the mitigation measures of the Final Program EIR for the 2022 AQMP in the event of a conflict between mitigation measures that would apply in a given situation.

---

### *Cumulative Impacts*<sup>120</sup>

Both the Final Program EIR for the 2022 AQMP and the Final Program EIR for the 2016 AQMP concluded that implementation of their respective AQMP control measures could result in significant adverse noise and vibration impacts during construction because vibration from construction activities could exceed the 72 vibration decibels (VdB) threshold for structures and sensitive receptors within 200 feet of construction activities if certain types of construction equipment were used.

When combined with the Connect SoCal Plan, the SIP strategies, state policies, and other past, present, and reasonably foreseeable activities, the 2022 AQMP would result in a significant increase to noise and vibration impacts during construction, and would contribute to cumulatively considerable impacts. No additional mitigation measures to reduce the significant cumulative impacts to noise and vibration during construction have been identified. Cumulative impacts to noise and vibration during construction for past, present, and reasonably foreseeable future projects would remain significant and unavoidable for noise and vibration.

The 2016 AQMP control measures would result in significant adverse noise and vibration impacts during construction and, when combined with past, present, and reasonably foreseeable activities, and in particular with transportation projects projected in the 2016 RTP/SCS, would contribute to cumulatively considerable impacts to noise impacts identified in the 2016 RTP/SCS, therefore resulting in a significant cumulative impact. No additional mitigation measures to reduce the significant cumulative impacts to noise were identified. Cumulative impacts to noise and vibration from implementation of the 2016 AQMP would remain significant and unavoidable.

### *Summary of Noise Analyses*

Table A-15 presents a summary of the noise analyses conducted in the 2022 AQMP and 2016 AQMP.

---

<sup>120</sup> See Section 4.6.5 Cumulative Noise Impacts and Mitigation Measures of the Final Program EIR for the 2022 AQMP and Section 5.13.1 Cumulative Impacts of the Final Program EIR for the 2016 AQMP

## Solid and Hazardous Waste

The Final Program EIR for the 2022 AQMP identified and analyzed potentially significant solid and hazardous waste impacts associated with disposal of spent diesel particulate filters. Both the Final Program EIR for the 2022 AQMP and the Final Program EIR for the 2016 AQMP identified construction activities for infrastructure development, and replacement and early retirement of vehicles and equipment to be potentially significant solid and hazardous waste impacts associated with implementation of PR 2306.

### Significance Criteria

Solid and hazardous waste impacts are significant if the generation and disposal of hazardous and non-hazardous waste exceeds the capacity of designated landfills.

Table A-16 summarizes the landfill capacity in South Coast AQMD jurisdiction, and is Table 3.7-2 Number of Class III Landfills Located within the South Coast AQMD's Jurisdiction and Related Landfill Capacity, from the Final Program EIR for the 2022 AQMP.

**Table A-16. Number of Class III Landfills Located within the South Coast AQMD's Jurisdiction and Related Landfill Capacity**

County	Number of Landfills	Permitted Capacity (tons per day)
Los Angeles	10	38,249
Orange	3	23,500
Riverside <sup>(1)</sup>	6	22,314
San Bernardino <sup>(1)</sup>	9	16,269
<b>Total</b>	<b>28</b>	<b>100,332</b>

(1) Data presented is for the entire county and not limited to the portion of the county within the South Coast AQMD jurisdiction.

### Solid and Hazardous Waste Impacts from Disposal of Spent Diesel Particulate Filters<sup>121</sup>

Implementation of Control Measures MOB-02A and MOB-02B could result in the use of diesel particulate filters (DPFs) to reduce diesel particulate matter, a toxic, from on-road heavy-duty vehicles, off-road construction equipment, and low-emitting engines on cargo handling equipment and locomotives. A DPF is an exhaust aftertreatment device that traps diesel particulate matter as ash which is a by-product of combustion engines that use diesel fuel. In order to reduce emissions from diesel engines, a DPF captures and stores exhaust soot, which must be periodically burned off to regenerate the filter media. The lifespan of a DPF varies based on the application and type of engine but can last from five to ten years or 10,000 or more hours of operation. During the regenerative process, no solid waste is generated. However, during the periodic cleaning of the DPF, the process involves manually removing the filter element from the housing and placing it

<sup>121</sup> See Section 4.7.3.2.2 Diesel Particulate Filters of the Final Program EIR for the 2022 AQMP and Section 4.6.4.2.2 Particulate Traps, Filters, and Precipitators of the Final Program EIR for the 2016 AQMP

in a cleaning station designed for this purpose. The ash is collected in the cleaning station and sent for disposal as solid waste. DPF ash is not specifically listed in the Federal Code of Regulations as a hazardous material, but there may be metallic oxides in the ash which are hazardous to the environment and public health. Waste generators that operate DPF cleaning stations can either dispose of the DPF ash as hazardous waste or can have the waste tested using the Toxicity Characteristic Leaching Procedure (TCLP) which is a process that replicates the leaching process that would naturally occur when waste is buried in a municipal landfill. If the leachate contains any of the regulated contaminants at concentrations that are equal to or greater than the regulatory levels, then the DPF ash is considered hazardous waste.

Diesel repair shops currently operate cleaning stations so any additional soot and ash removed from additional DPFs deployed as a result of implementing the control measures will be collected and disposed of in accordance with existing practices and applicable regulations for hazardous waste disposal. At the end of its useful life, a DPF has monetary value and is typically sent for recycling to recover the catalyst and the metal housing is sent to a scrap metal recycler, so solid waste is not expected from the disposal of DPFs. While the quantity of equipment that would utilize DPFs as result of implementing the control measures is unknown, the quantity of collected particulate matter typically recovered from one DPF during its cleaning is expected to be small such that the amount of additional DPF ash that would need to be disposed of in either local landfills or hazardous waste landfills, depending on the chemical characteristics of the DPF ash, would also be relatively small. Nonetheless, an increase in the use of DPFs may result in an incremental increase in solid waste requiring disposal in landfills over what would be produced if the 2022 AQMP were not adopted.

If based on the outcome of the TCLP process that the DPF ash collected during the filter cleaning process is not hazardous, then it could be disposed of as solid waste at a number of landfills located within South Coast AQMD's jurisdiction. The current permitted capacity of the landfills in Los Angeles, Orange, Riverside, and San Bernardino counties is about 100,332 tons per day (see Table A-16) and has sufficient capacity to handle the small increase in soot and ash collected during the DPF cleaning process. There are no hazardous waste landfills within the South Coast AQMD's jurisdiction. If the DPF ash is determined to be hazardous, the waste can be transported to permitted facilities located within and outside of California. There are two hazardous waste landfills in California: Clean Harbors landfill located in Buttonwillow and CWMI Kettleman Hills landfill in Kings County. The permitted capacity of Clean Harbors is in excess of 13 million cubic yards of waste material and the permitted capacity of CWMI Kettleman Hills is over 33 million cubic yards. Therefore, these two hazardous materials landfills would have sufficient capacity to handle the small amounts of waste that could be generated by ash collected from DPFs employed on equipment as part of implementing the control measures. Therefore, the Final Program EIR for the 2022 AQMP concluded that use of DPFs would generate less than significant levels of solid and hazardous waste in the form DPF ash which would need to be disposed of in either a municipal or hazardous waste landfill.

### *Solid and Hazardous Waste Impacts from Construction for Infrastructure Development*<sup>122</sup>

Control Measures MOB-02A and MOB-02B were expected to involve construction associated with the electrification of existing sources and the replacement of existing equipment. This construction could generate solid waste due to demolition and site preparation, grading, and excavating. Specifically, demolition activities could generate demolition waste while site preparation, grading, and excavating could uncover contaminated soils since the facilities affected by the control measures are located in existing industrial or commercial areas. Excavated soil, if found to be contaminated, would need to be characterized, treated, and disposed of offsite in accordance with applicable regulations. Where appropriate, the soil can be recycled for reuse if it is considered or classified as non-hazardous waste, or it can be disposed of at a landfill that accepts non-hazardous waste. Otherwise, the material will need to be disposed of at a hazardous waste facility.

Due to the uncertainty of the future capacity of the landfills within South Coast AQMD's jurisdiction and the broad scope of equipment that could undergo modifications or replacement, the Final Program EIR for the 2022 AQMP concluded the solid and hazardous waste impacts from construction to be potentially significant and mitigation measures were required. Since the project-specific mitigation for solid and hazardous waste impacts are the same for waste generated during construction and operation, the mitigation measures follow the discussion of operational impacts.

Similarly, implementation of 2016 AQMP control measures such as MOB-02 would result in construction which would generate waste attributable to the removal of soil, construction debris from demolition, etc., and some of this waste could be characterized as hazardous waste. The Final Program EIR for the 2016 AQMP determined that it would be speculative to estimate the amount of construction waste that would be generated if the 2016 AQMP was implemented, since the extent and timing of individual projects was not known. Therefore, the solid and hazardous waste impacts from construction were concluded to be significant.

### *Solid and Hazardous Waste Impacts from Replacement and Early Retirement of Vehicles and Equipment*<sup>123</sup>

Implementation of Control Measures MOB-02A, MOB-02B, and MOB-02 that encourage the early retirement of older vehicles and other mobile sources, and the replacement with newer equipment or newer vehicles (including electric or alternative fuel vehicles) could result in an increase in waste generated from spent batteries and non-salvageable material. AQMP mobile source pollution control measures would incentivize penetration of fuel cell and electric vehicles into the market. The potential quantities of retired vehicles are summarized by category in Tables A-17 and A-18 which compile information from Table 4.7-2 Potential Vehicle Retirements By Mobile Source Sector, from the Final Program EIR for the 2022 AQMP, and Table 4.6-2 Control Measures and Potential Vehicle Retirement Quantities, from the Final Program EIR for the 2016 AQMP, respectively.

---

<sup>122</sup> See Section 4.7.3.1 Solid and Hazardous Waste Associated with Construction Activities of the Final Program EIR for the 2022 AQMP and Section 4.6.4.4 Construction Waste of the Final Program EIR for the 2016 AQMP

<sup>123</sup> See Section 4.7.3.1.2 Solid Waste Impacts During Construction Due to Early Retirement of Equipment of the Final Program EIR for the 2022 AQMP and Section 4.6.4.3 Retirement of Equipment of the Final Program EIR for the 2016 AQMP

**Table A-17. Potential Vehicle Retirements By Mobile Source Sector**

Mobile Source Sector	Number of Potential Vehicle Retirements
Heavy-Duty Vehicles	8,214
Off-Road Construction	1,021
Other Off-Road and CHE	428
TRU	224
Locomotives	125
<b>Total:</b>	10,012

Source: 2022 AQMP Table 4-23. Based on active projects with emission reductions in 2037 using the maximum project life allowed per 2017 Carl Moyer Guidelines.

**Table A-18. Control Measures and Potential Vehicle Retirement Quantities**

CONTROL MEASURE NO.	CONTROL MEASURE DESCRIPTION	ESTIMATED NUMBER OF VEHICLES	
		2023	2031
MOB-01, MOB-02, MOB-03, MOB-04, OFFS-01, OFFS-04, OFFS-06	Accelerate the Penetration of Zero Emission TRUs, Forklifts, and Ground Support Equipment	50,000	100,00

The most common battery currently used in gasoline- and diesel-powered vehicles is the lead-acid battery found in conventional automobiles and trucks. These batteries are disposed of through the established lead recycling industry. However, zero emission vehicles operate with battery types that are different than the lead-acid battery; the most common type of battery used in electric vehicles is comprised of lithium ion technology (Li-ion). The increased operation of electric vehicles associated with the implementation of the AQMP mobile source measures may actually result in a reduction of the amount of solid and hazardous waste generated in the South Coast AQMD's jurisdiction, as Li-ion batteries have a much longer life span than conventional lead-acid batteries. The recycling of batteries is also required under law. Further, some manufacturers pay for used electric vehicle batteries. The value, size, and length of life of Li-ion batteries are such that recycling is expected to be more predominant than with lead acid batteries. Therefore, the use of electric vehicles is not expected to result in an increase in the illegal or improper disposal of electric batteries. Further, batteries associated with electric cars are required to be diverted from landfills. Therefore, no significant increase in the disposal of solid or hazardous waste is expected due to increased use of electric vehicles.

The primary solid waste impact from retiring more vehicles as part of implementing the control measures is the accelerated replacement and disposal of equipment and parts earlier than the end of their useful life. It is important to note that control measures do not mandate that older vehicle, engines, or other equipment be scrapped. The control measures allow for a number of different control methods to achieve the desired emission reductions, and the most cost-effective methods would be expected to be implemented. Control measures such as MOB-02A and MOB-02B that would foster a transition to putting new equipment into service will also generally result in the concurrent retirement of the older equipment. Alternatively, some measures may encourage the

advanced deployment of cleaner technologies without waiting for an equipment's end of useful life which will result in an air quality benefit. Scrap metal from vehicle replacements is expected to be recycled; however, some amount of waste-scraped vehicles and parts may be sent to landfills for disposal. Although recycling and diversion activities will reduce the amount of waste entering landfills, it is difficult to quantify the waste that will be generated from the early retirement of equipment or the salvageable amount that would be recycled.

The Final Program EIR for the 2022 AQMP concluded early retirement of equipment to have significant solid and hazardous waste impacts since available landfill space is limited to approximately 100,000 tons per day and only four of the solid waste landfills within the South Coast AQMD's jurisdiction have capacity past 2039.

The Final Program EIR for the 2016 AQMP similarly concluded early retirement of equipment to have significant solid and hazardous waste impacts because, although equipment that may be retired before the end of its useful life may be reused in areas outside the Basin and equipment with no remaining useful life is expected to be recycled for metal content, there would be a high volume of vehicle and equipment to retire in a short timeframe and uncertainty of their outcome.

Construction waste from infrastructure development and operational waste from the early retirement of equipment were identified as generating potentially significant solid and hazardous waste impacts. Feasible mitigation measures SHW-1 to SHW-3 for reducing impacts related to solid and hazardous waste were adopted in the Final Program EIR for the 2022 AQMP. Even after mitigation measures SHW-1 to SHW-3 were applied, the Final Program EIR for the 2022 AQMP concluded that the solid and hazardous waste impacts would remain significant (see pages 4.7-24 to 4.7-25 of the Final Program EIR for the 2022 AQMP). The Final Program EIR for the 2016 AQMP, however, did not identify mitigation measures feasible of reducing solid and hazardous waste impacts.

#### *Mitigation Measures Adopted in the Final Program EIR for the 2022 AQMP for Solid and Hazardous Waste*<sup>124</sup>

- SHW-1 During the planning, design, and project-level CEQA review process for individual development projects, lead agencies shall coordinate with waste management agencies and the appropriate local and regional jurisdictions to facilitate the development of measures and to encourage diversion of solid waste such as recycling and composting programs, as needed. This includes discouraging siting of new landfills unless all other waste reduction and prevention actions have been fully explored to minimize impacts to neighborhoods.
- SHW-2 The lead agency should coordinate with waste management agencies, and the appropriate local and regional jurisdictions, to develop measures to facilitate and encourage diversion of solid waste such as recycling and composting programs.
- SHW-3 In accordance with CEQA Guidelines Sections 15091(a)(2) and 15126.4(a)(1)(B), a Lead Agency for a project should consider mitigation measures to reduce the generation of solid waste, as applicable and feasible. These may include the integration of green building measures consistent with CALGreen (California

---

<sup>124</sup> See Section 4.7.3.2.5 Wood and Greenwaste of the Final Program EIR for the 2022 AQMP

Building Code Title 24) into project design including, but not limited to the following:

- 1) Reuse and minimization of construction and demolition (C&D) debris and diversion of C&D waste from landfills to recycling facilities.
- 2) Include a waste management plan that promotes maximum C&D diversion.
- 3) Pursue source reduction through: a) the use of materials that are more durable and easier to repair and maintain; b) design to generate less scrap material through dimensional planning; c) increased recycled content; d) the use of reclaimed materials; and e) the use of structural materials in a dual role as finish material (e.g., stained concrete flooring, unfinished ceilings, etc.).
- 4) Reuse existing structure and shell in renovation projects.
- 5) Develop indoor recycling program and space.
- 6) Discourage the siting of new landfills unless all other waste reduction and prevention actions have been fully explored. If landfill siting or expansion is necessary, site landfills with an adequate landfill-owned, undeveloped land buffer to minimize the potential adverse impacts of the landfill in neighboring communities.
- 7) Discourage exporting locally generated waste outside of the southern California region during the construction and implementation of a project. Encourage disposal within the county where the waste originates as much as possible. Promote green technologies for long-distance transport of waste (e.g., clean engines and clean locomotives or electric rail for waste-by-rail disposal systems) and consistency with South Coast AQMD and Connect SoCal policies can and should be required.
- 8) Encourage waste reduction goals and practices and look for opportunities for voluntary actions to exceed the 80 percent waste diversion target.
- 9) Encourage the development of local markets for waste prevention, reduction, and recycling practices by supporting recycled content and green procurement policies, as well as other waste prevention, reduction and recycling practices.
- 10) Develop ordinances that promote waste prevention and recycling activities such as requiring waste prevention and recycling efforts at all large events and venues, implementing recycled content procurement programs, and developing opportunities to divert food waste away from landfills and toward food banks and composting facilities.
- 11) Develop and site composting, recycling, and conversion technology facilities that have minimum environmental and health impacts.
- 12) Integrate reuse and recycling into residential industrial, institutional and commercial projects.
- 13) Provide education and publicity about reducing waste and available recycling services.

- 14) Implement or expand city or county-wide recycling and composting programs for residents and businesses. This could include extending the types of recycling services offered (e.g., to include food and green waste recycling) and providing public education and publicity about recycling services.

### *Cumulative Impacts*<sup>125</sup>

The Final Program EIR for the 2022 AQMP concluded that implementation of the 2022 AQMP could result in significant adverse solid and hazardous waste impacts due to the uncertainty of the future capacity of the landfills within South Coast AQMD's jurisdiction to address waste from construction of infrastructure and early retirement of vehicles and equipment. When combined with the Connect SoCal Plan, the SIP strategies, state policies, and other past, present, and reasonably foreseeable activities, the 2022 AQMP would result in a significant increase in solid and hazardous waste, and would contribute to cumulatively considerable impacts. No additional mitigation measures to reduce the significant cumulative impacts to solid and hazardous waste have been identified. Cumulative impacts to solid and hazardous waste for past, present, and reasonably foreseeable future projects would remain significant and unavoidable for solid and hazardous waste.

The Final Program EIR for 2016 AQMP concluded that implementation of Control Measure MOB-02 would result in significant adverse solid and hazardous waste impacts due to a high volume of vehicle and equipment being retired in a short timeframe and uncertainty of their outcome. Other 2016 AQMP control measures would also result in significant adverse solid and hazardous waste impacts due to construction. The 2016 AQMP control measures would result in significant adverse solid and hazardous waste impacts and, when combined with past, present, and reasonably foreseeable activities, and in particular with transportation projects projected in the 2016 RTP/SCS, would contribute to cumulatively considerable impacts to solid and hazardous waste identified in the 2016 RTP/SCS, therefore resulting in a significant cumulative impact. No additional mitigation measures to reduce the significant cumulative impacts to solid and hazardous waste were identified. Cumulative impacts to solid and hazardous waste from implementation of the 2016 AQMP would remain significant and unavoidable.

### *Summary of Solid and Hazardous Waste Analyses*

Table A-19 presents a summary of the solid and hazardous waste analyses conducted in the 2022 AQMP and 2016 AQMP.

---

<sup>125</sup> See Section 4.7.5 Cumulative Solid and Hazardous Waste Impacts and Mitigation Measures of the Final Program EIR for the 2022 AQMP and Section 5.17.1 Cumulative Impacts of the Final Program EIR for the 2016 AQMP

**Table A-19. Summary of Solid and Hazardous Waste Analysis in the Final Program EIRs for the 2022 AQMP and 2016 AQMP**

Significance Criteria	Potentially Significant Impacts	Mitigation Measures	Cumulative Impacts
<p>Solid and hazardous waste impacts are significant if any of the following conditions occur:</p> <ul style="list-style-type: none"> <li>• If the generation and disposal of hazardous and non-hazardous waste exceeds the capacity of designated landfills.</li> </ul>	<p>Implementation of Control Measures MOB-02A and MOB-02B from the 2022 AQMP and Control Measure MOB-02 from the 2016 AQMP would cause potentially significant solid and hazardous waste impacts from:</p> <ul style="list-style-type: none"> <li>• Construction waste for infrastructure development, and</li> <li>• Operational waste from the early retirement of equipment</li> </ul>	<p>SHW-1 to SHW-3 of the Final Program EIR for the 2022 AQMP</p> <p>No mitigation measures related to solid and hazardous waste impacts were identified and adopted in the Final Program EIR for the 2016 AQMP.</p>	<p>Cumulative impacts to solid and hazardous waste impacts for past, present, and reasonably foreseeable future projects would remain significant and unavoidable because of potential increases in waste produced during construction and operation activities.</p>

### ***ENVIRONMENTAL TOPIC AREAS WITH LESS THAN SIGNIFICANT OR NO IMPACTS***

Since PR 2306 implements Control Measures MOB-02A, MOB-02B, and MOB-02 of the 2022 AQMP and 2016 AQMP without adding new impacts or modifying the previously analyzed impacts for each environmental topic area, the overall conclusions of less than significant or no impacts in the Final Program EIR for the 2022 AQMP and Final Program EIR for the 2016 AQMP will remain unchanged if PR 2306 is adopted.

Because the environmental topic areas of air quality and greenhouse gas emissions from operation and hydrology and water quality were identified as having potential adverse impacts, the following discussion first summarizes the analysis of less than significant impacts for the environmental topic areas of air quality and greenhouse gas emissions from operation, and hydrology and water quality before summarizing the analysis of other environmental topic areas having no significant adverse impacts.

#### **Air Quality and Greenhouse Gas Emissions**

The Final Program EIR for the 2022 AQMP and Final Program EIR for the 2016 AQMP concluded that implementation of control measures, such as MOB-02A, MOB-02B, and MOB-02, would generate potentially significant air quality impacts during construction, less than significant operational air quality impacts, and potentially significant short-term increases in GHG emissions that would be offset and eventually result in a long-term net reduction in GHG emissions.

#### ***Air Quality Impacts from Operation<sup>126</sup>***

The Final Program EIR for the 2022 AQMP contemplated that implementation of Control Measures MOB-02A and MOB-02B of 2022 AQMP has the potential to promote the transition to zero emission technologies, and this transition is expected to require additional electricity; increase the demand for alternative fuels production (e.g., hydrogen or renewable fuels), and the potential air quality impacts from production facilities; and accelerate the purchase of zero emission or low NOx emitting equipment and vehicles that would replace older equipment and vehicles, thereby increasing the scrapping of equipment and vehicles faster than would normally occur.

Implementing Control Measures MOB-02A and MOB-02B was expected to result in electricity demand increase by developing infrastructure to provide electricity at rail yards, and intermodal facilities for electrified vehicles and equipment; deploying cleaner technologies including the electrification of equipment currently powered by diesel fuel; and incentivizing the retirement and replacement of older vehicles and equipment with electric vehicles and equipment. While the Final Program EIR for 2022 AQMP identified the potential electricity usage associated with approximately half the mobile source control measures, specific data pertaining to the number of units that may be deployed was not available. Thus, a net increase in electricity usage as well as the air quality impacts associated with the potential increase in electrified mobile sources was not quantified. Nonetheless, gasoline and diesel fuel use and their corresponding combustion emissions were expected to decrease as the demand for electricity increases, displaced by combustion emissions from natural gas, which is the primary fuel used for generating electricity within South Coast AQMD's jurisdiction. SB 100 requires that the electrical infrastructure needed to support the increased deployment of electric vehicles and other electrified equipment would

---

<sup>126</sup> See Section 4.2.5.2 Criteria Pollutants – Operational Activities of the Final Program EIR for the 2022 AQMP and Section 4.1.6.2 Criteria Pollutants – Operational Activities of the Final Program EIR for the 2016 AQMP

need to have 100 percent renewable electricity generation by 2045. As mobile sources transition from combustion to electrified technology, the amount of emissions from combusting diesel and gasoline is expected to decline over time. However, the combustion emissions from natural gas utilized in electricity-producing equipment will increase over the short-term until the SB 100 goals of producing electricity from 100 percent renewables are achieved.

Implementing Control Measures MOB-02A and MOB-02B was expected to increase the demand for alternative fuels including renewable transportation fuels (e.g., renewable diesel) and hydrogen. The Final Program EIR for the 2022 AQMP referenced several renewable fuels projects that were recently approved in California, and implementation of the control measures were anticipated to cause an increase in the demand for renewable fuels such that additional renewable fuels projects (e.g., hydrogen production facilities) may be needed. Due to the difficulty and length of time involved with siting and permitting new industrial facilities in general, the development of new facilities dedicated to producing alternative fuels is less likely to occur. Instead, existing industrial facilities are more likely to propose modifications in order to produce renewable fuels. Renewable fuels production requires energy input to reconfigure the molecules of the renewable feedstocks into transportation fuels, and the energy input is currently provided by large combustion sources (i.e., heaters or furnaces). In addition, renewable fuels production requires hydrogen as part of the reaction. Based on the CEQA analyses conducted for such projects, conversion of petroleum refinery equipment to be able to produce renewable fuels has the potential to decrease emissions facility-wide provided that hydrogen production facilities are already in place. However, when existing hydrogen production facilities are not available or cannot produce sufficient supplies of hydrogen needed to produce renewable fuel, a new hydrogen plant may be required which may cause significant adverse air quality impacts.

Implementing Control Measures MOB-02A and MOB-02B was expected to accelerate the purchase of zero emission or low NO<sub>x</sub> emitting equipment and vehicles that would replace older equipment and vehicles, thereby increasing the scrapping of equipment and vehicles faster than would normally occur. The actual quantity of equipment and vehicles that may be scrapped as a result of implementing these control measures rather than being moved for use elsewhere outside of South Coast AQMD's jurisdiction was not known. In addition, the available capacity of scrapping facilities to be able to handle and process the increased amount of equipment and vehicles to be scrapped was unknown. During the development of Rule 1610 – Old-Vehicle Scrapping, emissions associated with vehicle scrapping were estimated to be 0.088 pound of PM<sub>10</sub> emissions per vehicle scrapped. [South Coast AQMD, 1992]. According to an internet search conducted on August 15, 2022, there were eight auto recycling facilities operating within South Coast AQMD's jurisdiction.<sup>127</sup> Assuming that six vehicles can be crushed per hour (Martin, 2013) and each facility operates 10 hours per day, a total 480 vehicles can be crushed per day (8 facilities x 6 cars/hour x 10 hours/day = 480 cars/day). Therefore, vehicle scrapping has the potential to generate 42 pounds of PM<sub>10</sub> per day, which is less than the South Coast AQMD's operational significance threshold of 150 pounds per day. Applying the CARB's CEIDARS profile 900 ratio

---

<sup>127</sup> State of California Auto Dismantlers Association, 2022, Members Direct Search, <https://scada1.org/find-member>, August 12, 2022.

for unspecified sources of 0.6 pound of PM<sub>2.5</sub> per pound of PM<sub>10</sub><sup>128,129</sup>, a corresponding 25 pounds per day of PM<sub>2.5</sub> emissions can be expected, and this is less than the PM<sub>2.5</sub> significance threshold of 55 pounds per day.

Thus, operational activities resulting from implementation of control measures such as MOB-02A and MOB-02B in the 2022 AQMP were expected to generate less than significant criteria pollutant air quality impacts. Since no significant air quality impacts relating to operational activities were identified, no mitigation measures were necessary or required.

The Final Program EIR for the 2016 AQMP contemplated that implementation of Control Measure MOB-02 has the potential to accelerate the replacement of locomotive engines in freight service or employ add-on devices to meet the lower emission standard; increase the use of alternative fuels such as biodiesel, LNG, CNG, ethanol, and hydrogen; and reduce mobile source emissions, in particular, emissions of diesel particulate matter (DPM) from engine exhaust.

Implementing Control Measure MOB-02 would potentially accelerate the replacement of locomotive engines in freight service or employ add-on devices to meet the lower emission standard. As such, control measure MOB-02 may generate air quality impacts from add-on devices. Locomotives are typically refurbished, and a new engine installed so no scrapping of the locomotives are expected. Add-on devices, such as particulate filters have an increase in fuel use associated with the decrease in fuel economy associated with the type of add-on device, which the Final Program EIR for 2016 AQMP estimated to be less than one percent. Therefore, there was a potential for an increase in emissions from the increase in fuel use. However, the number of locomotives to be equipped with add-on devices versus replaced was not known. Therefore, quantification of the air quality impacts would be speculative.

Implementing Control Measure MOB-02 has the potential to increase the use of alternative fuels such as biodiesel, LNG, CNG, ethanol, and hydrogen. The availability of the producers of alternative fuels to meet the increase in demand has the potential for an increase in emissions associated with the increased production. Production of the alternative fuels such as LNG and CNG require little processing with less emissions than the production of refined petroleum products such as gasoline, diesel, and jet fuel. While biodiesel and ethanol production do require more processing than LNG and CNG, the production processes are less complicated than petroleum refining. Biodiesel is made from a catalytic chemical process similar to one or two processes in a typical refinery, which will have many units available to produce refined products from crude oil. Ethanol is produced by fermentation. Biodiesel and ethanol can be made from renewable sources such as vegetable oils, sugar cane, corn, and animal fats. Therefore, the production of alternative fuels, especially biofuels, typically generates less air emissions than a petroleum refinery would when producing similar gasoline or gasoline equivalent amounts. Any increase in emissions attributable to an increased production of alternative fuels would be offset

---

<sup>128</sup> CARB's California Emissions Inventory Data Analysis and Reporting System (CEIDARS) is a database management system developed to track statewide criteria pollutant and air toxic emissions; <https://ww2.arb.ca.gov/criteria-pollutant-emissioninventory-data>.

<sup>129</sup> South Coast AQMD, 2006. Final Methodology to Calculate Particulate Matter (PM) 2.5 and PM 2.5 Significance Thresholds, Table A. [http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/particulate-matter-\(pm\)-2.5-significance-thresholds-and-calculation-methodology/final\\_pm2\\_5methodology.pdf](http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/particulate-matter-(pm)-2.5-significance-thresholds-and-calculation-methodology/final_pm2_5methodology.pdf).

by reduced levels of petroleum fuel production and transportation of crude oil primarily from overseas and possibly by rail, as diesel and gasoline demand decreases.

Implementing Control Measure MOB-02 would reduce mobile source emissions, in particular, emissions of diesel particulate matter (DPM) from engine exhaust, which is a known carcinogen, as well as toxic components of gasoline such as benzene and 1,3-butadiene. This mobile source control measure would result in replacing existing vehicles or equipment with more efficient vehicles or equipment, zero emission electric vehicles or equipment, or alternative fueled vehicles or equipment. Combustion emissions of alternative fuels have trace amounts of methanol and aldehyde, but, generally, are considered to be cleaner and less toxic than diesel or gasoline fueled vehicles. Emissions from power generating equipment may include trace amounts of benzene, aldehydes, metals, and polynuclear aromatic hydrocarbons. However, if the process being electrified was previously powered by direct combustion of fossil fuels, then electrification was expected to result in an overall decrease in toxic emissions.

Thus, operational activities resulting from implementation of control measures such as MOB-02 in the 2016 AQMP were expected to generate less than significant criteria pollutant air quality impacts. Since no significant air quality impacts relating to operational activities were identified, no mitigation measures were necessary or required.

### *Greenhouse Gas Emissions Impacts<sup>130</sup>*

The Final Program EIR for the 2022 AQMP contemplated that implementation of Control Measures MOB-02A and MOB-02B would cause an increase in GHGs due to construction activities. Both the Final Program EIR for the 2022 AQMP and Final Program EIR for the 2016 AQMP contemplated that the rail yard control measures would cause an increase in GHGs due to increased electricity usage, but also a decrease in GHGs due to the conversion from conventional fuels to alternative fuels.

Implementing Control Measures MOB-02A and MOB-02B may involve construction activities which may emit GHGs. South Coast AQMD policy regarding GHG emissions from construction is to amortize construction emissions over a 30-year timeframe and add the result to operational emissions. The magnitude of construction GHG emissions will vary greatly depending on the project. Installation of electrical infrastructure projects (e.g., charging stations) typically does not require large amounts of construction equipment as they are installed in parking lots of existing facilities. Minimal trenching and foundation work is necessary, and these actions typically require the most construction equipment. On the other hand, alternative fuels production facilities would be much larger projects involving more, and larger capacity construction equipment which may rely on diesel or gasoline to operate. The combined GHG construction emissions from all projects requiring construction as a result of implementing the control measures in the 2022 AQMP, would represent a relatively small portion of the total GHG emission impacts, especially considering that the operational GHG emissions will be substantially reduced relative to the existing setting and will likely offset any increases in construction GHGs.

Of the total fuel consumed in Los Angeles, Orange, Riverside and San Bernardino counties, transportation sources account for over 50 percent of fuel use and these sources are also the main

---

<sup>130</sup> See Section 4.2.5.5 Greenhouse Gas Emissions of the Final Program EIR for the 2022 AQMP and Section 4.1.6.4 Greenhouse Gas Emissions of the Final Program EIR for the 2016 AQMP

contributors to NO<sub>x</sub> emissions. Within the transportation sector, diesel-powered sources emit the majority of NO<sub>x</sub>. With regards to mobile source control measures, accelerating the replacement of conventional vehicles with electric vehicles or alternative fueled vehicles into fleets regulated by the South Coast AQMD may produce emissions from increased electricity generation meanwhile the zero emission vehicles will not emit anything and the alternative fueled vehicles will emit fewer criteria pollutants, fewer toxics, and fewer GHGs. As such, the net effect of replacing gasoline and diesel mobile sources is expected to have greater overall GHG emission reduction benefits because the GHG emissions produced from generating the electricity needed to power one electric vehicle are fewer than the GHG emissions from one gasoline or diesel vehicle.

As mentioned in the Energy section, the Final Program EIR for the 2022 AQMP estimated that, compared to the 2018 baseline for electricity demand, implementation of the 2022 AQMP control measures is expected to increase electricity use by 13,429 GWh, approximately an 11 percent increase, by 2037 which will produce approximately 2.76 million metric tons (MMT) of GHG emissions.<sup>131</sup> The Final Program EIR for the 2016 AQMP estimated that, compared to the 2014 baseline, energy demand from 2016 AQMP control measures was expected to increase by 10,227 GWh, a 7.8 percent increase, by the year 2023 and produce 3.4907 million metric tons (MMT) of GHG emissions. Similarly, compared to the 2014 baseline, energy demand from 2016 AQMP control measures is expected to increase by 18,029 GWh, a 12.7 percent increase, by the year 2031 and produce 6.1496 MMT of GHG emissions.

The Final Program EIR for the 2022 AQMP estimated that implementing 2022 AQMP mobile source control measures has the potential to reduce total annual petroleum-based fuel use by approximately 1.5 billion gallons in milestone year 2030 and by approximately 1.8 billion gallons in milestone year 2037. Using a CO<sub>2</sub> emission factor of 8.10 kilograms per gallon (kg/gal) for gasoline and a CO<sub>2</sub> emission factor of 10.19 kg/gal for diesel, GHG emission reductions can be calculated for both gasoline and diesel in each milestone year. Similarly, at the time of developing the 2016 AQMP, the Final Program EIR for the 2016 AQMP estimated that implementing 2016 AQMP mobile source control measures has the potential to reduce total annual petroleum fuel use by approximately 530 million gallons in milestone year 2023. By milestone year 2031, total annual petroleum fuel use was expected to reduce by approximately 870 million gallons. Tables A-20 and A-21, which are Table 4.2-16 Estimated GHG Emissions Impacts from 2022 AQMP Control Measures, from the Final Program EIR for the 2022 AQMP and Table 4.1-6 Estimated GHG Emission Impacts from 2016 AQMP Control Measures, from the Final Program EIR for the 2016 AQMP, show that the net effect of implementing the AQMP control measures while concurrently reducing petroleum-based fuel use in mobile sources is expected to result in an overall reduction of GHG emissions.

**Table A-20. Estimated GHG Emissions Impacts from 2022 AQMP Control Measures**

<b>Description</b>	<b>2037 CO<sub>2</sub>eq Emissions (MMT)</b>
Increased Electricity Use	<b>2.18</b>
Change in Gasoline Use	<b>-2.23</b>
Change in Diesel Use	<b>-15.57</b>
Net Change in Emissions	<b>-15.62</b>

Description	2023 CO <sub>2eq</sub> Emissions <sup>(a)</sup> (million metric tons)	2031 CO <sub>2eq</sub> Emissions <sup>(a)</sup> (million metric tons)
Increased Electricity <sup>(b)</sup>	3.4907	6.1496
Change in Gasoline Use	-2.9766	-3.1238
Change in Diesel Use	-4.2970	-3.4305
Net Change in Emissions	-3.7829	-0.4047

(a) Source: Emission factors are from CARB, et al., 2010.

(b) Electricity generation is weighted by population in the LADWP and SCE service areas. Negative numbers represent emission reductions.

Converting gasoline- and diesel-fired sources to electrified equipment reliant on electricity that is primarily generated by natural gas and renewable sources is expected to result in an overall decrease of GHG emissions. The electricity needed to power zero-emission equipment is expected to be provided by public utility companies. Most existing power generating facilities are subject to Assembly Bill 32 and will be required to reduce their GHG emissions. Moreover, any future power generating stations that may be built in response to meeting the future electricity demand would be subject to stringent emission control requirements, including those for GHG emissions. Therefore, after taking into consideration the short-term increases in GHG emissions which will be offset by substantial reductions of GHG emissions from the decreased use of gasoline and diesel fuels combined with the overarching goal of transitioning to electricity sourced with 100 percent renewables by 2045 as required by Senate Bill 100 (SB 100, De León) the additional electricity that may be needed to implement the 2022 AQMP control measures has been determined to generate less than significant GHG emission impacts.

Implementing 2022 AQMP control measures also have the potential to increase the use of alternative fuels. Alternative fuels generally generate fewer or equivalent GHG emissions compared to gasoline and diesel when combusted. When comparing the overall benefit between various types of alternative fuels, the production methods used to generate the fuels must be considered (sometimes referred to as well-to-wheel energy and emission impacts). A comparison of various production methods showed that using hydrogen as a fuel reduces more GHG emissions when compared to reformulated gasoline, except when the hydrogen is produced by electrolysis using grid-supplied electricity, in which case the comparison is dependent on the renewable to non-renewable mix of the electricity generation.<sup>132</sup> While alternative fuel and hydrogen production facilities may increase GHG emissions, the overall GHG reductions associated with the use of the transportation fuels produced were expected to be greater than the GHG emissions from producing the fuels.

Implementing Control Measures such as MOB-02A and MOB-02B is expected to have GHG emissions associated with construction over the short-term; however, construction GHG emissions are amortized over 30 years and are much less than the overall potential operational emissions reductions of GHGs over the long-term. GHG emissions from the generation and use of additional electricity and alternative fuels, were not expected to be significant because there would be

<sup>132</sup> Alternative Fuels Data Center, 2022. Fuel Cell Electric Vehicle Emissions, [https://afdc.energy.gov/vehicles/emissions\\_hydrogen.html](https://afdc.energy.gov/vehicles/emissions_hydrogen.html), accessed August 17, 2022.

concurrent decreases in the use of diesel- and gasoline-fueled equipment over time as more electric and alternative fuel vehicles are deployed. Finally, electricity generation is required to transition to 100 percent renewables by 2045 as required by SB 100. Thus, implementation of Control Measure MOB-02A, MOB-02B, and MOB-02 was expected to result in potentially significant GHG operational emissions over the short-term and less than significant GHG emission impacts over the long-term. Since less than significant greenhouse gas impacts overall were identified, no mitigation measures were necessary or required.

Relative to cumulative impacts, the Final Program EIR for the 2022 AQMP and Final Program EIR for the 2016 AQMP concluded that implementation of the 2022 AQMP, when combined with past, present, and reasonably foreseeable activities, would contribute to impacts to air quality during construction, but would not contribute to cumulatively considerable impacts to air quality during operation or GHG emissions. There are no new impacts which would change the previous conclusions of the Final Program EIR for the 2022 AQMP and Final Program EIR for the 2016 AQMP regarding cumulatively considerable impacts to air quality. Further, no new mitigation measures would be required. Therefore, the cumulative impacts to air quality would remain significant and unavoidable.

### Hydrology and Water Quality

The Notice of Preparation/Initial Study for the 2022 AQMP concluded that implementation of Control Measures MOB-02A and MOB-02B would have no potential adverse impacts related to hydrology and water quality; therefore, it was not further analyzed in the Final Program EIR for the 2022 AQMP. However, the Final Program EIR for the 2016 AQMP concluded that implementation of Control Measure MOB-02 would cause less than significant impacts to surface and ground water quality from accidental spills of alternative fuels or additives, and potential illegal disposal of batteries from electric vehicles and hybrids. Thus, the following summary will focus only on the hydrology and water quality impacts identified in the Final Program EIR for the 2016 AQMP for Control Measure MOB-02.

#### *Significance Criteria*

Hydrology and water quality impacts are significant if any of the following conditions occur:

##### Water Demand

- The existing water supply does not have the capacity to meet the increased demands of the project, or the project would use more than 262,820 gallons per day of potable water.
- The project increases demand for total water by more than five million gallons per day.

##### Water Quality

- The project will cause degradation or depletion of ground water resources substantially affecting current or future uses.
- The project will cause the degradation of surface water substantially affecting current or future uses.
- The project will result in a violation of National Pollutant Discharge Elimination System (NPDES) permit requirements.
- The capacities of existing or proposed wastewater treatment facilities and the sanitary sewer system are not sufficient to meet the needs of the project.

- The project results in substantial increases in the area of impervious surfaces, such that interference with groundwater recharge efforts occurs.
- The project results in alterations to the course or flow of floodwaters.

### *Hydrology and Water Quality Impacts from Accidental Spills of Alternative Fuels or Additives<sup>133</sup>*

The Final Program EIR for the 2016 AQMP identified that implementation of Control Measure MOB-02 could result in the increased penetration of electric vehicle vehicles but may also result in the increased use of alternative fuels (e.g., biodiesel fuels, compressed natural gas, liquefied natural gas, and hydrogen). In general, alternative fuels are expected to be less toxic than conventional fuels and follow a similar path as the low sulfur diesel. Biodiesel is a fuel derived from biological sources such as vegetable oils or animal fats. Biodiesel can be used pure or blended with conventional diesel. Because the biodiesel typically comes from vegetable oils or animal fats, it is generally less toxic and more biodegradable than conventional diesel, so the water quality impacts from a spill of biodiesel would be less than a spill of conventional diesel. The most common blended biodiesel is B20, which is 20 percent biodiesel and 80 percent conventional diesel. Therefore, the potential water quality impacts from the transport and storage of biodiesel and biodiesel blends were not expected to be substantially different than the transport and storage of conventional diesel.

The other types of alternative fuels that may be used as part of implementing Control Measure MOB-02 in the 2016 AQMP include compressed natural gas, liquefied natural gas, and hydrogen. Because all of these fuels exist as a gas at standard temperatures and pressures, a leak of any of these fuels would result in an airborne release, and not a release that could adversely affect water quality. There are a number of rules and regulations currently in place that are designed to minimize the potential impacts from underground leaking storage tanks and spills from fueling activities, including requirements for the construction of the storage tanks, requirements for double containment, and installation of leak detection systems. These regulations would also apply to any leaks of alternative fuels from storage tanks. Thus, the use of alternative fuels was not expected to result in any greater adverse water quality impacts than the current use of conventional fuels like diesel or gasoline.

Moreover, the Final Program EIR for 2016 AQMP identified the possibility of accidental spills from implementation of Control Measure MOB-02. A spill at any of the affected facilities could occur under upset conditions such as an earthquake. Spills could also occur from corrosion of containers, piping and process equipment, and leaks from seals or gaskets at pumps and flanges. A major earthquake would be a potential cause of a large spill. Other causes could include human or mechanical error. Construction of the vessels, and foundations in accordance with the California Building Code requirements helps structures to resist major earthquakes without collapse but may result in some structural and non-structural damage following a major earthquake. As required by U.S. EPA's spill prevention control and countermeasure regulations, all of the affected facilities are required to have emergency spill containment equipment and would implement spill control measures in the event of an earthquake. Storage tanks typically have secondary containment such

---

<sup>133</sup> See Section 4.5.3.2 Water Quality Impacts of the Final Program EIR for the 2022 AQMP and Section 4.4.4.2.2 Accidental Spills of the Final Program EIR for the 2016 AQMP

as a berm, which would be capable of containing 110 percent of the contents of the storage tanks onsite. Therefore, should a rupture occur, the contents of the tank would be collected within the containment system and pumped to an appropriate storage tank. Spills at affected industrial or commercial facilities would be collected within containment structures. Large spills outside of containment areas at affected facilities that could occur when transferring the material from a transport truck to a storage tank are expected to be captured by the process water system where they could be collected and controlled. Spilled material would be collected and pumped to an appropriate tank or sent off-site if the materials cannot be used on-site. The existing rules and requirements that limit the extent or prevent spills are expected to minimize impacts on water quality to less than significant levels. For this reason, accidental spills were not expected to create significant water quality impacts.

### *Hydrology and Water Quality Impacts from Illegal Disposal of Batteries<sup>134</sup>*

Implementation of Control Measure MOB-02 of the 2016 AQMP could contribute to an increased use of electric vehicles and other mobile sources. Since some batteries contain toxic materials, water quality impacts are possible if the batteries are disposed of in an unsafe manner, such as by illegal dumping or by disposal in a landfill. As interest in the use of electric vehicles has increased over the years, battery technologies have been developing and improving. Most battery technologies employ materials that are recyclable, since regulatory requirements and market forces encourage recycling. California laws create incentives and requirements for disposal of recycling of batteries as follows.

- Under CARB regulations, to certify either a new ZEV or retrofit an existing ZEV, automakers must complete CARB's certification application, which must include a battery disposal plan. Thus, current regulations require ZEV manufacturers to take account for the full life-cycle of car batteries and to plan for safe disposal or recycling of battery materials. For example, Toyota has offered \$200 per battery to minimize illegal disposal of batteries.
- California and federal law require the recycling of lead-acid batteries (California Health & Safety Code Section 25215). Spent lead-acid batteries being reclaimed are regulated under 22 CCR Section 66266.80 and 66266.81, and 40 CFR part 266, Subpart G.
- California law requires state agencies to purchase car batteries made from recycled material (Public Resources Code Section 42440).
- California passed the Household Universal Waste Rule in February 2006, which prohibits the landfill disposal household wastes such as batteries, electronic devices, and fluorescent light bulbs by anyone.

Existing battery recovery and recycling programs have limited the disposal of batteries in landfills. For example, the recycling of lead-acid and nickel-cadmium batteries is already a well-established activity. One secondary lead smelter (facilities that recycle lead-bearing materials) is currently located within the Basin. The secondary lead smelter receives spent lead-acid batteries and other lead bearing material and processes them to recover lead and polypropylene (from the battery casings). Acid is collected and recycled as a neutralizing agent in the wastewater treatment system. Other facilities available for battery recycling are located outside of the Basin. Further penetration

---

<sup>134</sup> See Section 4.4.4.2.4 Electric Vehicles of the Final Program EIR for the 2016 AQMP

of partial-zero and zero emission mobile sources in the Basin is expected to result in a reduction in the use of lead-acid batteries and a subsequent reduction in the lead-acid batteries that need to be recycled, after the vehicle/equipment is scrapped or has left the Basin.

Li-ion batteries are more common in electric vehicles and becoming more popular in hybrids. Because Li-ion batteries have a potential for after-automotive use, destructive recycling can be postponed for years even after an EV or hybrid battery can no longer hold and discharge sufficient electricity to power a car's motor. The battery pack can still carry a tremendous amount of energy. Battery manufacturers project that the battery packs will still be able to operate at about 80 percent of capacity the time they must be retired from automotive use [Edmunds, 2014]. Auto companies are partnering with battery, recycling, and electronics firms to figure out and develop post-automotive markets and applications for Li-ion battery packs [Green Car Reports, 2014]. With the opportunity for other uses, Li-ion battery recycling may not be as necessary as recycling of lead-acid batteries.

The illegal disposal of batteries from EVs and hybrids has the potential to result in significant water quality impacts by allowing toxic or hazardous metals or acids to leach into surface or ground waters. However, because battery recycling is required by law and because they have value, the illegal or improper disposal of batteries is expected to be uncommon. For example, because some manufacturers pay for used EV/hybrid batteries, the value, size, and length of life of NiMH and Li-ion batteries are such that recycling is expected to be more predominate than with lead acid batteries. Therefore, the use of EVs and hybrids are not expected to result in an increase in the illegal or improper disposal of batteries because these types of batteries are required to be recycled and thus, reducing the potential water quality impacts cause by illegal disposal. Based on the foregoing analysis, less than significant adverse water quality impacts are expected from the increased use of EV and hybrid vehicles and no new mitigation measures would be required.

Relative to cumulative impacts, the Final Program EIR for the 2016 AQMP concluded that implementation of the 2016 AQMP would not contribute to cumulatively considerable impacts to water quality but would contribute to cumulatively considerable impacts to water demand. However, since implementation of Control Measure MOB-02 and therefore PR 2306 is not expected to have impact to water demand, there are no new impacts which would change the previous conclusions of the Final Program EIR for the 2016 AQMP regarding cumulatively considerable impacts to hydrology and water quality. Further, no new mitigation measures would be required. Therefore, the cumulative impacts to hydrology and water quality would remain significant and unavoidable.

### **Other Environmental Topic Areas**

The 2022 AQMP and 2016 AQMP were designed to reduce emissions from existing emission sources and promote the use of the cleanest technology available. The 2022 AQMP and 2016 AQMP would accelerate the replacement of high-emitting mobile sources with low NOx and zero-emission mobile sources; encourage the use of lower-emitting alternative fuels; affect stationary sources at existing commercial/industrial facilities and residential developments; develop incentives to remove/replace higher emitting equipment; establish greater control of industrial stationary sources; control indirect sources of emissions; improve energy efficiency; improve emission leak detection and maintenance procedures; and establish educational and outreach programs. The analysis provided in the Final Program EIR for 2022 AQMP concluded that the following environmental topic areas would have no potential adverse impacts due to

implementation of Control Measures MOB-02A and MOB-02B: aesthetics, agriculture and forestry resources, biological resources, cultural and tribal cultural resources, geology and soils, hydrology and water quality, land use and planning, mineral resources, population and housing, public services, recreation, transportation, and wildfire. Since no impacts were identified, no mitigation measures were necessary or required for these environmental topic areas.

Similarly, the analysis provided in the Final Program EIR for 2016 AQMP concluded that the following environmental topic areas would have no potential impacts due to implementation of Control Measure MOB-02: aesthetics, agriculture and forestry resources, biological resources, cultural and tribal cultural resources, geology and soils, land use and planning, mineral resources, noise, population and housing, public services, recreation, transportation, and wildfire. Since no impacts were identified, no mitigation measures were necessary or required for these environmental topic areas. Since PR 2306 implements Control Measures MOB-02A, MOB-02B, and MOB-02 without adding new or modifying the previously analyzed impacts for each environmental topic area, the overall conclusions of no impacts for these environmental topic areas in the Final Program EIRs for the 2022 AQMP and 2016 AQMP will remain unchanged if PR 2306 is implemented.

The following summaries provide the background regarding the no potential adverse impacts conclusions of each aforementioned environmental topic area.

*Aesthetics*<sup>135</sup>: For both the 2022 AQMP and 2016 AQMP, the majority of control measures implemented within South Coast AQMD's jurisdiction would typically affect industrial, institutional, or commercial facilities located in appropriately zoned areas (e.g., industrial and commercial areas) that are not usually associated with scenic resources. Further, modifications would typically occur within the confines of the affected facilities, or because of the nature of the business (e.g., commercial or industrial), can easily blend in with the facilities with little or no noticeable effect on adjacent areas. Also improved air quality would provide benefits to scenic vistas and resources throughout South Coast AQMD's jurisdiction. Mobile source control measures were designed to accelerate the replacement of high emitting on-road and off-road mobile sources with lower-emitting mobile sources. Accelerating the penetration of lower-emitting mobile sources into market would not be expected to adversely affect scenic resources because these strategies do not require construction or disturbance to such resources.

The Final Program EIR for the 2022 AQMP indicated that Control Measures MOB-02A and MOB-02B could potentially encourage the use of overhead power lines (catenary lines) to provide electricity. The areas affected by the zero emission and low NOx control measures that could result in the installation of catenary lines are expected to be located in commercial, industrial areas, and along existing truck and rail transportation corridors. The truck and rail corridors likely to be involved are primarily associated with rail yards and intermodal facilities in industrial zones within Southern California, and container transfer facilities near the Terminal Island Freeway, along the Alameda Corridor, as well as inland rail yards near downtown Los Angeles. The roadway eligible for state scenic highway designation, nearest to either of the ports, the cargo transfer facilities serving the ports, along the Alameda Corridor, or the downtown rail yards, would be Route 1 (Pacific Coast Highway at State Route 19 – Lakewood Boulevard, in Long Beach) in the

---

<sup>135</sup> See Section 4.8.1 Aesthetics of the Final Program EIR for the 2022 AQMP and Section 4.8 Aesthetics of the Final Program EIR for the 2016 AQMP

southernmost portion of Los Angeles County. There are approximately five miles between the cargo transfer facilities serving the ports, to the intersection of State Route 19 and Route 1 (the point at which the roadway becomes eligible for designation as a state scenic highway). The potential locations for catenary overhead power lines (near the ports' facilities, transportation corridors and rail yards) would not be visible to Route 1 at State Route 19 due to the numerous existing structures and topography between the two locations or any other scenic highways. There are no officially designated scenic highways or highways eligible for state scenic highway designation in areas affected by construction of zero emission or low NOx equipment associated with Control Measures MOB-02A and MOB-02B; therefore, construction impacts on aesthetics were considered to be less than significant.

The Final Program EIRs for the 2022 AQMP and 2016 AQMP concluded that implementation of Control Measures MOB-02A, MOB-02B and MOB-02, was not expected to create additional demand for new lighting or exposed combustion sources (e.g., flares) that could create glare, adversely affecting day or nighttime views in any areas. Facilities affected by the control measures typically make modifications to light sources within property borders, so any new light sources would typically be inside a building or not noticeable because of the presence of existing outdoor light sources. Based on these considerations, less than significant aesthetic impacts were expected due to the implementation of the 2022 AQMP and 2016 AQMP.

*Agriculture and Forestry Resources*<sup>136</sup>: The Final Program EIRs for the 2022 AQMP and 2016 AQMP concluded that implementation of Control Measures MOB-02A, MOB-02B, and MOB-02, was not expected to generate any new construction of buildings or other structures that would require conversion of farmland to non-agricultural use, conflict with zoning for agricultural uses, or a Williamson Act contract. Further, the analysis concluded that implementing the 2022 AQMP and 2016 AQMP would typically affect existing facilities that are located in appropriately zoned areas. Should any new facilities be constructed and operated, their planning would occur for reasons other than implementation of the 2022 AQMP and the 2016 AQMP. New facilities and improvements to existing facilities would continue to be subject to project-level review, including review of agricultural impacts under CEQA by the applicable local land use authority. Therefore, implementation of the 2022 AQMP and 2016 AQMP would not affect Prime Farmland, Unique Farmland, or Farmland of Statewide Importance, or conflict with a Williamson Act contract, if implemented. Physical changes associated with the 2022 AQMP and 2016 AQMP were expected to occur at previously developed sites and would not require construction to occur in undeveloped areas where agricultural and forest resources are more likely to exist. The 2022 AQMP and 2016 AQMP, including control measures related to mobile sources, would have no direct or indirect effects on agricultural or forest land resources because their focus is on achieving emission reductions by increasing the penetration of zero and low NOx technologies into market. The 2022 AQMP and 2016 AQMP could provide benefits to agricultural and forest land resources by improving air quality in the region, thus reducing the adverse oxidation impacts of ozone on plants and animals. Based on these considerations, no agriculture and forestry resources impacts were expected due to the implementation of the of the 2022 AQMP and 2016 AQMP.

---

<sup>136</sup> See Section 4.8.2 Agriculture and Forestry Resources of the Final Program EIR for the 2022 AQMP and Section 4.9.1 Agriculture and Forestry Resources of the Final Program EIR for the 2016 AQMP

**Biological Resources:** Implementation of the 2022 AQMP and 2016 AQMP control measures, including MOB-02A, MOB-02B, and MOB-02, was not expected to result in habitat modification, adversely affect any riparian habitat, or interfere with the movement of any native resident or migratory fish or wildlife species. Facilities affected by the 2022 AQMP and 2016 AQMP control measures have already been disturbed and typically do not contain open space, water features, or natural vegetation. Sites might contain landscaping that consists of ornamental trees, vegetation, and turf. The sites of the affected facilities that would be subject to the control measures were not expected to support riparian habitat, federally protected wetlands, or migratory corridors because they are existing, developed, and established industrial and commercial facilities. Additionally, special status plants, animals, or natural communities identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service were not expected to be found on or in close proximity to the affected facilities. Construction projects that impact affected species were not reasonably foreseeable as part of implementation of the 2022 AQMP and 2016 AQMP. Any new development potentially affecting biological resources would not be as a result of the 2022 AQMP and 2016 AQMP control measures and approval of those projects, including evaluation of their environmental impacts, would occur regardless of the 2022 AQMP and 2016 AQMP and would be subject to project-level CEQA review. Based upon these considerations, no biological resources impacts are expected from implementing the 2022 AQMP and 2016 AQMP.

**Cultural and Tribal Cultural Resources<sup>137</sup>:** Commercial and industrial areas are generally not located in historic districts. For this reason, the Final Program EIRs for the 2022 AQMP and 2016 AQMP concluded that the implementation of Control Measures MOB-02A, MOB-02B, and MOB-02 would not be expected to cause a substantial adverse change in the significance of a historical resource. The South Coast AQMD also provided a formal notice of the Notice of Preparation/Initial Study (NOP/IS) prepared for the 2022 AQMP and 2016 AQMP to all California Native American Tribes (Tribes) that requested to be on the Native American Heritage Commission's (NAHC) notification list per Public Resources Code Section 21080.3.1(b)(1). The NAHC notification list provides a 30-day period during which a Tribe may respond to the formal notice, in writing, requesting consultation on a proposed project. No Tribes requested consultation during the 30-day comment period of each NOP/IS. The provisions of CEQA, Public Resources Code Section 21080.3.1 et seq. (also known as AB 52), require meaningful consultation with California Native American Tribes on potential impacts to tribal cultural resources, as defined in Public Resources Code Section 21074. Tribal cultural resources are sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either eligible or listed in the California Register of Historical Resources or local register of historical resources. As part of the AB 52 process, Native American tribes must submit a written request to the relevant lead agency if it wishes to be notified of projects that require CEQA public noticing and are within its traditionally and culturally affiliated geographical area. Construction resulting from implementation of the control measures would need to obtain city or county planning department approvals prior to commencement of any construction activities, and would be subject to project-level review, including separate tribal consultation pursuant to AB 52, as applicable, to address site-specific requests identified by the tribes. Therefore, impacts to tribal

---

<sup>137</sup> See Section 4.8.4 Cultural and Tribal Cultural Resources of the Final Program EIR for the 2022 AQMP and Section 4.9.3 Cultural Resources of the Final Program EIR for the 2016 AQMP

cultural resources were considered to be less than significant, and the 2022 AQMP and 2016 AQMP were not expected to cause any impacts to significant historic cultural resources.

*Geology and Soils*<sup>138</sup>: The 2022 AQMP and 2016 AQMP, including Control Measures MOB-02A, MOB-02B, and MOB-02, would not directly or indirectly expose people or structures to earthquake faults, seismic shaking, seismic-related ground failure including liquefaction, lateral spreading, landslides, mudslides, or substantial soil erosion. Affected facilities or modifications to affected facilities, including the construction of new electricity or hydrogen infrastructure, would be required to comply with relevant California Building Code requirements in effect at the time of initial construction or modification of a structure. Projects that occur as a result of the 2022 AQMP and 2016 AQMP are largely expected to occur at commercial and industrial areas, and have a small construction footprint. Construction activities would be subject to local, regional, and state codes and requirements for erosion control and grading during construction. Projects would be subject to the National Pollution Discharge Elimination System (NPDES) permitting regulations, including the development and implementation of a Stormwater Pollution Prevention Plan (SWPPP) as applicable. Construction contractors would be required to prepare and implement a SWPPP and associated Best Management Practices (BMPs) in compliance with the Construction General Permit (CGP) during grading and construction of any site that disturbs more than one acre of land. Adherence to the BMPs in the SWPPP and adherence with local, regional, and state codes and requirements for erosion control and grading during construction would reduce, prevent, or minimize soil erosion from grading and construction activities. Therefore, soil erosion impacts were concluded to be less than significant.

Paleontological resources, commonly known as fossils, are the recognizable physical remains or evidence of past life forms found on earth in past geological periods — and can include bones, shells, leaves, tracks, burrows, and impressions. Ground-disturbing activities such as grading or excavation have the potential to unearth paleontological resources. Most facilities affected by 2022 AQMP and 2016 AQMP control measures would be located on previously disturbed industrial and commercial sites where there is little likelihood of identifiable artifacts. It is possible, however, that cultural or archaeological resources or human remains may nevertheless be discovered. New installations of air pollution control equipment or infrastructure for zero-emission and low-NOx equipment are unlikely to require substantial soil excavation and would be located on already disturbed and developed industrial land uses. Further, projects implemented as a result of the 2022 AQMP and 2016 AQMP would be subject to project-level review, including review of both geological and paleontological impacts under CEQA, as applicable. Therefore, the Final Program EIRs for the 2022 AQMP and 2016 AQMP concluded that implementation of all of the control measures, including Control Measures MOB-02A, MOB-02B, and MOB-02, would not be expected to destroy a unique paleontological resource or site or unique geological feature, or result directly or indirectly in other significant adverse geology or soils impacts. Therefore, geology and soils impacts were concluded to be less than significant.

---

<sup>138</sup> See Section 4.8.5 Geology and Soils of the Final Program EIR for the 2022 AQMP and Section 4.9.4 Geology and Soils of the Final Program EIR for the 2016 AQMP

***Land Use and Planning***<sup>139</sup>: Since the 2022 AQMP and 2016 AQMP do not require construction of major new land use developments in any areas within South Coast AQMD’s jurisdiction, none of the control measures, including Control Measures MOB-02A, MOB-02B, and MOB-02, were expected to physically divide any established communities within South Coast AQMD’s jurisdiction. Potential land use impacts associated with the 2022 AQMP and 2016 AQMP could come from the construction of support systems (e.g., catenary overhead electrical lines or magnetic infrastructure related to operation of zero- and low-NOx transport systems). For purposes of evaluating potential land use impacts, the analysis assumed that no new rail or truck traffic routes would be constructed, but rather that existing truck and rail routes and corridors would be modified. The truck and rail corridors likely to be involved are primarily associated with rail yards and intermodal facilities in industrial zones within the Southern California area. Since only existing transportation routes would likely be modified (e.g., electric lines installed) and no new transportation routes were anticipated, no land use conflicts, or inconsistencies with any general plan, specific plan, local coastal program, or zoning ordinance were expected. Activities that result from implementing the various 2022 AQMP and 2016 AQMP control measures would be subject to project-level review that would assess consistency with adopted land use regulations, including review of impacts to land use and planning under CEQA, as applicable. Any proposed modification to an existing rail or truck traffic route/corridor would require a separate CEQA evaluation. No land use impacts were identified because any activities undertaken to implement the 2022 AQMP and 2016 AQMP control measures would be expected to comply with, and not interfere with, applicable land use plans, policies, or regulations of an agency with jurisdiction over the project, including, but not limited to the general plans, specific plans, local coastal programs or zoning ordinances.

***Mineral Resources***<sup>140</sup>: There were no provisions in the 2022 AQMP and 2016 AQMP that would result in the loss of availability of a known mineral resource of value to the region and the residents of the state, or of a locally-important mineral resource recovery site delineated in a local general plan, specific plan, or other land use plan. The 2022 AQMP and 2016 AQMP provide incentives for the penetration of low-NOx and zero-emission technologies into market which are not expected to result in an increase in the use of mineral resources. The Final Program EIRs for the 2022 AQMP and 2016 AQMP concluded that there would be no impacts on the use of important minerals. Therefore, no new demand for mineral resources was expected to occur and no mineral resources impacts from implementing the 2022 AQMP and 2016 AQMP were anticipated.

***Population and Housing***<sup>141</sup>: The Final Program EIRs for the 2022 AQMP and 2016 AQMP concluded that implementing the control measures would not generate any significant effects, either direct or indirect, on the population or population distribution of people living in the South Coast AQMD’s jurisdiction as no additional workers were anticipated to be required in order to implement the 2022 AQMP and 2016 AQMP. Consistent with past experience, it was expected that the existing labor pool within the southern California area would accommodate the labor

---

<sup>139</sup> See Section 4.8.6 Land Use Planning of the Final Program EIR for the 2022 AQMP and Section 4.9.5 Land Use Planning of the Final Program EIR for the 2016 AQMP

<sup>140</sup> See Section 4.8.7 Mineral Resources of the Final Program EIR for the 2022 AQMP and Section 4.9.6 Mineral Resources of the Final Program EIR for the 2016 AQMP

<sup>141</sup> See Section 4.8.8 Population and Housing of the Final Program EIR for the 2022 AQMP and Section 4.9.7 Population and Housing of the Final Program EIR for the 2016 AQMP

requirements for any modifications requiring construction at affected facilities. Additionally, the 2022 AQMP and 2016 AQMP, including Control Measures MOB-02A, MOB-02B, and MOB-02, contain no provisions that would cause displacement of substantial numbers of people or housing necessitating construction of replacement housing elsewhere. Accordingly, no population and housing impacts were expected from implementing Control Measures MOB-02A, MOB-02B, and MOB-02.

**Public Services<sup>142</sup>:** Fire protection and emergency medical services would be provided to affected facilities and residential developments by local county and city fire departments. Although the implementation of the Control Measures MOB-02A and MOB-02B from the 2022 AQMP, and Control Measure MOB-02 from the 2016 AQMP would require the use of alternative fuels (e.g., hydrogen), the alternative fuels would displace gasoline and diesel fuels and if a fire occurs, the same fire protection and emergency medical services would be needed. As first responders to emergency situations, fire departments are trained to respond to a variety of situations related to hazardous materials. Large industrial facilities (e.g., electric generating plants and refineries) have on-site fire response personnel and the local fire departments provide assistance to the on-site personnel. Therefore, no increase in calls for fire protection, and emergency medical service would be expected from implementation of the control measures. All activities undertaken as a result of implementing the 2022 AQMP and 2016 AQMP, including Control Measures MOB-02A, MOB-02B, and MOB-02, would be required to comply with fire-related safety features in accordance with the applicable provisions of the adopted California Fire Code, any county or city ordinances, and standards regarding fire prevention and suppression measures related to water improvement plans, fire hydrants, fire access, and water availability. Based on the preceding discussion, implementation of the 2022 AQMP and 2016 AQMP would not adversely affect the ability of local fire protection to provide adequate service. As such, these impacts were concluded to be less than significant. Implementation of the 2022 AQMP and 2016 AQMP would also not result in an increase in calls for police protection. Implementation of the 2022 AQMP and 2016 AQMP are expected to occur at existing facilities or promote transition to cleaner emitting equipment at new developments but would not facilitate the construction of new development. At existing industrial facilities, on-site security is typical and would be expected to continue with the same demand for police department support as is currently needed. Furthermore, implementation of the 2022 AQMP and 2016 AQMP would not induce population growth either directly or indirectly. Therefore, with no increase in local population, there would be no additional demand for new or expanded schools, parks, and libraries and no other adverse population or housing impacts were expected. Implementation of the 2022 AQMP and 2016 AQMP would generate less than significant impacts to public services.

**Recreation<sup>143</sup>:** Demand for parks and recreational facilities in an area is usually determined by the area's population. As explained earlier in the Population and Housing section of this Appendix, implementation of the 2022 AQMP and 2016 AQMP does not require or include the development of new homes, which would lead to an increase in population and thereby, the need for additional park and recreation facilities. Therefore, the implementation of the 2022 AQMP and 2016 AQMP,

---

<sup>142</sup> See Section 4.8.9 Public Services of the Final Program EIR for the 2022 AQMP and Section 4.9.8 Public Services of the Final Program EIR for the 2016 AQMP

<sup>143</sup> See Section 4.8.10 Recreation of the Final Program EIR for the 2022 AQMP and Section 4.9.9 Recreation of the Final Program EIR for the 2016 AQMP

including Control Measures MOB-02A, MOB-02B, and MOB-02, would not increase the use of existing neighborhood and regional parks or other recreational facilities, nor would it require construction of new or expanded parks or recreational facilities. No impacts to park and recreational facilities would occur.

*Transportation*<sup>144</sup>: Implementation of the 2022 AQMP and 2016 AQMP, including Control Measures MOB-02A, MOB-02B, and MOB-02, were not expected to substantially alter vehicle mileage or transportation routes. The 2022 AQMP relied upon transportation and related Transportation Control Measure (TCMs) developed by Southern California Association of Governments (SCAG) and included in the SCAG Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS)<sup>145</sup>. Therefore, the 2022 AQMP would not conflict with a program plan, ordinance, or policy addressing the transportation circulation system, including transit, roadway, bicycle, and pedestrian facilities. Implementation of the 2022 AQMP has the potential to result in an increase in transportation related to construction of new or modified air pollution control equipment. Construction trips and vehicle miles traveled (VMT) are associated with contractors and vendors delivering and installing equipment at affected facilities. Construction activity impacts are temporary in nature and will vary depending on the number and location of facilities, and the size of the construction workforce needed. The Technical Advisory on Evaluating Transportation Impacts in CEQA to comply with CEQA Guidelines Section 15064.3 focuses on permanent, new employee VMT. [State of California, Governor’s Office of Planning and Research, 2018]. Because of the temporary nature of construction activities, any increase in VMT related to construction activities would occur on a short-term basis at each location. In general, temporary construction-related increases in VMT are not considered to be a transportation impact or inconsistent with the requirements in CEQA Guidelines Section 15064.3, as they do not have a permanent impact on regional VMT. Additionally, discretionary projects at affected facilities could be subject to project-level review under CEQA. Therefore, temporary effects of construction-related vehicles would not conflict with the state’s GHG reduction and associated VMT goals for the transportation sector. CEQA Guidelines Section 15064.3(a) clarifies that the primary consideration in evaluating a project’s transportation impacts for CEQA purposes is the amount and distance that a project might cause people to drive. This captures two measures of transportation impacts: number of automobile trips generated and VMT. Additional permanent employees were not expected to be required to operate equipment that may require additional air pollution control equipment, due to implementation of the 2022 AQMP. As discussed previously in the Population and Housing section of this Appendix, implementation of the 2022 AQMP and 2016 AQMP were not expected to generate additional employee or population increases. Therefore, no increase in vehicle trips or VMT was expected. Therefore, the Final Program EIR for the 2022 AQMP concluded that less than significant impacts were expected from implementing the 2022 AQMP, including Control Measures MOB-02A and MOB-02B.

Similarly, the Notice of Preparation/Initial Study for the 2016 AQMP concluded that implementation of Control Measure MOB-02 would not result in potential adverse transportation

---

<sup>144</sup> See Section 4.8.11 Transportation of the Final Program EIR for the 2022 AQMP and Section 4.7 Transportation and Traffic of the Final Program EIR for the 2016 AQMP

<sup>145</sup> Southern California Association of Governments, Connect SoCal (2020–2045 Regional Transportation Plan/Sustainable Communities Strategy), May 2020. <https://scag.ca.gov/read-plan-adopted-final-connect-social-2020>

and traffic impacts, but other control measures would generate direct or indirect adverse impacts based on the anticipated methods of control. Therefore, the Final Program EIR for the 2016 AQMP did not further evaluate transportation and traffic impacts from implementing Control Measure MOB-02 (see Table 4.7-1 Control Measures with Potential Transportation and Traffic Impacts, in the Final Program EIR for the 2016 AQMP). Less than significant impacts from the implementation of Control Measure MOB-02 could be expected to occur.

**Wildfire<sup>146</sup>:** The analysis in the Final Program EIR for the 2022 AQMP determined that activities that result from implementing the 2022 AQMP, including Control Measures MOB-02A and MOB-02B, would not block or otherwise interfere with the use of evacuation routes; nor would they interfere with operations of emergency response agencies or with coordination and cooperation between such agencies. Therefore, the analysis concluded that there would be no impacts on emergency activities. Implementation of these control measures were found to: affect existing commercial/industrial facilities; accelerate the replacement of high-emitting mobile sources with low NOx and zero emission mobile sources; control indirect sources of emissions; and develop incentives to remove/replace higher emitting equipment. However, since commercial and industrial areas are not typically located near wildland or forested areas, the analysis concluded that implementation of these control measures would not be expected to increase the risk of wildland fires. For this reason, the analysis in the Final Program EIR for the 2022 AQMP concluded that implementation of Control Measures MOB-02A and MOB-02B would have no impact to wildfires.

Relative to the analysis of the topic of wildfire in the Final Program EIR for the 2016 AQMP, it is important to note that the environmental topic area of wildfire was added to the Environmental Checklist in the CEQA Guidelines in 2019. Previous to this change in the CEQA Guidelines, the topic of the topic of fire hazards, including fires on wildlands, was analyzed in the biological resources and hazards and hazardous materials sections, as was the case for the Final Program EIR for the 2016 AQMP. Specifically, the Notice of Preparation/Initial Study for the 2016 AQMP, which is an appendix within the Final Program EIR for the 2016 AQMP, concluded that there would be no impact to the wildfire-related environmental checklist questions under the topics of biological resources and the hazards and hazardous materials.

**Conclusion for Other Environmental Topic Areas:** In summary, relative to cumulative impacts, the Final Program EIRs for the 2022 AQMP and 2016 AQMP concluded that implementation of Control Measures MOB-02A, MOB-02B, and MOB-02, when combined with past, present, and reasonably foreseeable activities, would not contribute to cumulative considerable impacts to the following environmental topic areas: aesthetics, agriculture and forestry resources, biological resources, cultural and tribal cultural resources, geology and soils, land use and planning, mineral resources, population and housing, public services, recreation, transportation, and wildfire.

Since implementation of Control Measures MOB-02A and MOB-02B of the 2022 AQMP and Control Measure MOB-02 of 2016 AQMP, upon which PR 2306 relies, is not expected to have potential adverse impacts on any of the aforementioned environmental topic areas, there are no new impacts which would change the previous conclusions of the Final Program EIRs for the 2022 AQMP and 2016 AQMP regarding cumulatively considerable impacts. Further, no new mitigation

---

<sup>146</sup> See Section 4.8.12 Wildfire of the Final Program EIR for the 2022 AQMP

measures would be required. Therefore, there are no cumulative impacts to the environmental topic areas of aesthetics, agriculture and forestry resources, biological resources, cultural and tribal cultural resources, geology and soils, land use and planning, mineral resources, population and housing, public services, recreation, transportation, and wildfire.

### *CONCLUSION*

PR 2306 implements Control Measures MOB-02A and MOB-02B that were previously adopted in the 2022 AQMP and Control Measure MOB-02 that was previously adopted in the 2016 AQMP. Control Measures MOB-02A and MOB-02B of the 2022 AQMP and Control Measure MOB-02 of the 2016 AQMP were previously analyzed in the Final Program EIRs for the 2022 AQMP and 2016 AQMP, respectively, and implementation of PR 2306 is not expected to result in new or modified physical changes or impacts that were not previously analyzed in the Final Program EIRs for the 2022 AQMP and 2016 AQMP specific to Control Measures MOB-02A, MOB-02B, and MOB-02.

The Final Program EIR for the 2022 AQMP concluded that implementation of the 2022 AQMP would result in potentially significant impacts to the environmental topic areas of air quality and greenhouse gas emissions, energy, hazards and hazardous materials, hydrology and water quality, noise, and solid and hazardous waste. Implementation of Control Measures MOB-02A and MOB-02B would have potentially significant impacts to: 1) air quality from construction because emissions on a peak day could exceed South Coast AQMD's significance thresholds; 2) energy because Basin-wide electricity usage would exceed baseline electricity consumption by more than one percent, natural gas demand is expected to increase in the short-term, and little excess hydrogen capacity is available to meet the increased demand such that additional hydrogen production facilities will be required; 3) hazards and hazardous materials because construction of new natural gas pipelines to service hydrogen production facilities may be a potential torch fire risk to receptors; 4) noise because vibration from construction activities could exceed the 72 vibration decibels (VdB) threshold for structures and sensitive receptors within 200 feet of construction activities if certain types of construction equipment were used; and 5) solid and hazardous waste due to the uncertainty of the future capacity of the landfills within South Coast AQMD's jurisdiction to address waste from construction of infrastructure and early retirement of vehicles and equipment. Implementation of Control Measures MOB-02A and MOB-02B would have less than significant impacts to air quality from operation and greenhouse gas emissions, and no impact to hydrology and water quality.

For environmental topic areas which were concluded in the Final EIR for the 2022 AQMP to have potentially significant impacts, mitigation measures were adopted. Nonetheless, no environmental topic area identified as having a potentially significant impact in the Final Program EIR for the 2022 AQMP was concluded to be capable of being mitigated to less than significant levels. When combined with the Connect SoCal Plan, the SIP strategies, state policies, and other past, present, and reasonably foreseeable activities, implementation of the 2022 AQMP would result in significant environmental impacts. No additional feasible mitigation measures to reduce the significant cumulative impacts were identified, and cumulative impacts to the environmental topic areas of air quality and greenhouse gas emissions, energy, hazards and hazardous materials, hydrology and water quality, noise, and solid and hazardous waste remained significant and unavoidable.

The Final Program EIR for 2016 AQMP concluded that implementation of the 2016 AQMP would result in potentially significant impacts to the environmental topic areas of aesthetics, air quality and greenhouse gas emissions, energy, hazards and hazardous materials, hydrology and water quality, noise, solid and hazardous waste, and transportation and traffic. Implementation of Control Measure MOB-02 would have potentially significant impacts to: 1) energy because Basin-wide electricity usage would exceed baseline electricity consumption by more than one percent; and 2) solid and hazardous waste due to a high volume of vehicle and equipment being retired in a short timeframe and uncertainty of their outcome. Implementation of Control Measure MOB-02 would have less than significant impacts to the environmental topic areas of air quality and greenhouse gas emissions, hazards and hazardous materials, and hydrology and water quality; and no impact to aesthetics, noise, and transportation and traffic.

As explained in the “Summary of Environmental Impact Analysis from the Final Program EIRs for the 2022 AQMP and the 2016 AQMP,” mitigation measures were adopted for certain environmental topic areas which had conclusions of potentially significant impacts. Nonetheless, no environmental topic area identified as having a potentially significant impact was capable of being mitigated to less than significant levels. When combined with the other past, present, and reasonably foreseeable activities, in particular the transportation projects projected in the 2016 RTP/SCS, implementation of the 2016 AQMP would result in significant environmental impacts. No additional mitigation measures to reduce the significant cumulative impacts were identified, and cumulative impacts to the environmental topic areas of aesthetics, air quality and GHG emissions, energy, hazards and hazardous materials, hydrology and water quality, noise, solid and hazardous waste, and transportation and traffic remained significant and unavoidable.

The aforementioned impacts analyzed in the Final Program EIR for the 2022 AQMP and the Final Program EIR for the 2016 AQMP are the same as what would occur if PR 2306 is implemented.

Therefore, the environmental impacts associated with implementing PR 2306 are within the scope of what was previously analyzed in the Final Program EIR for the 2022 AQMP for Control Measures MOB-02A and MOB-02B, and Final Program EIR for the 2016 AQMP for Control Measure MOB-02. Thus, no new Initial Study would need to be prepared leading to either an EIR or a Negative Declaration pursuant to CEQA Guidelines Section 15168(c)(2). PR 2306 does not introduce new information which will cause new significant effects or substantially worsen or make more severe significant effects that were previously analyzed in the Final Program EIRs for the 2022 AQMP and 2016 AQMP. There is no change to the mitigation measures or alternatives previously considered in the Final Program EIRs for the 2022 AQMP and 2016 AQMP. Thus, in accordance with CEQA Guidelines Section 15168(c)(2), a subsequent EIR would not be required pursuant to Public Resources Code Section 21166 and CEQA Guidelines Section 15162.

Based on the preceding analysis, pursuant to CEQA Guidelines Section 15168(c)(2), PR 2306 is considered a later activity within the scope of the 2022 AQMP and 2016 AQMP which were analyzed in the Final Program EIRs for the 2022 AQMP and 2016 AQMP. The mitigation measures developed in the Final Program EIRs for the 2022 AQMP and 2016 AQMP for the previously adopted Control Measures MOB-02A, MOB-02B and MOB-02 in the 2022 AQMP and 2016 AQMP upon which PR 2306 relies are also applicable to the implementation of PR 2306 and will remain in effect. [CEQA Guidelines Section 15168(c)(3)].

Therefore, PR 2306 is considered a later activity within the scope of the Final Program EIRs for the 2022 AQMP and 2016 AQMP and the Final Program EIRs for the 2022 AQMP and 2016

AQMP adequately describe the later activity for the purposes of CEQA such that no new environmental document will be required.

## ***INTRODUCTION***

Implementation of the AQMP Facility Based Mobile Source Measures, and subsequently PR 2306 development, began in 2017. Over the span of this time, staff has continued to solicit public input and feedback by engaging with various stakeholders including communities impacted by freight rail yard emissions, potentially affected businesses and industries, environmental organizations, trade associations, public agencies, and others. All stakeholder feedback from this public process has informed this rule development effort and helped shape the current version of the proposed rules. This appendix includes responses to the comments received after the release of preliminary draft rule package for PR 2306 and PR 316.2 (on May 17, 2024), either through written comment letters submitted using mail services or electronic mail, or expressed verbally or in writing during the Public Workshop for PR 2306 and PR 316.2 which was held on June 4, 2024.

## ***PUBLIC WORKSHOP COMMENTS***

Staff held a Public Workshop (PW) on June 4, 2024, to provide an overview of PR 2306 and PR 316.2 using a virtual webinar platform. Verbal comments transcribed from the PW recording and written comments provided in the questions and answers (Q&A) box on the virtual platform, can be found below, along with staff responses.

### **Comment PW-1 from an anonymous attendee**

Will the Barstow BNSF Railyard or Barstow International Gateway be directly impacted by the implementation of PR 2306?

#### ***Staff Response to Comment PW-1***

PR 2306 and PR 316.2 apply to freight rail yards within the South Coast AQMD jurisdiction. Barstow BNSF Railyard and the proposed Barstow International Gateway will not be directly impacted by the proposed rules because they are located outside of the South Coast AQMD jurisdiction. Those rail yards are therefore not subject to PR 2306 and PR 316.2.

### **Comment PW-2 from Brianna Egan with Californians for Electric Rail**

Thank you for your work on this rule and for engaging with community members and stakeholders. As a member of Californians for Electric Rail, I want to share our support for regulations that facilitate a clean energy transition for freight railyards and locomotives. Specifically, we feel that freight rail electrification with overhead catenary wires (gold standard technology for zero emissions freight rail around the world) will be a key to reducing pollution in frontline communities. <https://calelectricrail.org/>. Is the South Coast AQMD providing guidance on technology for zero emissions infrastructure for freight operators? I'd like to see rail electrification projects (and not hydrogen fueling) be a primary focus of the zero emissions plans.

#### ***Staff Response to Comment PW-2***

PR 2306 is fuel- and technology-neutral with respect to the type(s) of fuel planned to be used to support zero emission infrastructure and the specific type(s) of technology used to reduce freight rail yard emissions.

**Comment PW-3 from Bobby Jo Chavarria with Sierra Club**

3-a) I really appreciate the work that has been put into establishing this rule and including some of the concerns that Sierra Club members have had. With the new facilities we would like to see a zero-emission requirement at the beginning of when the reporting period starts or as soon as the facility is operational.

3-b) We want to make sure that we raise robust public awareness on the reporting mechanisms for the applicable facilities since we are relying heavily on self-reporting and communities have more awareness on the operational changes of these facilities.

3-c) We appreciate the infrastructure component that requires the facilities to take a look at what it will take to transition to zero emission or cleaner equipment. Additionally, it would make sense to work with individuals who are already planning out the infrastructure and to make sure there is partnership and technical advice that can be given. A sub-committee working on that component can ensure the transition much quicker than what the rule is requiring.

3-d) What is the estimate on how often there are owner or operator changes in the rail yards that we have in the district?

3-e) Nobody wants full exemptions. There is plenty of distinction on which operations are subject to the rule and it is very clear. This parsing of words makes it clear as to why an ISR is required for ports and rail yards. Otherwise, no action would ever be taken. Clean up your act, ports!

**Staff Response to Comment PW-3**

3-a) PR 2306 requires both new and existing freight rail yards to reduce emissions at levels that are proportional or more-than-proportional to implementation of statewide regulations throughout California. While the statewide regulations require zero emission operation for certain freight rail yard emission sources, technological feasibility has not yet been required for other sources such as railcar TRUs. PR 2306 is consistent with statewide rules, which do not establish requirements for new facilities that is different than for existing facilities.

3-b) As part of potential rule implementation, staff is committed to working with the communities in providing accessible information to the public based on rule compliance reporting, absent any business confidentiality limitations. Staff also conducted a survey poll during the Community Workshop held on June 5, 2024, as a preliminary effort to solicit feedback on existing information reporting tools or platforms for staff to consider as it develops a public information portal.

3-c) Staff appreciates the comment and suggestion for how to further facilitate zero emission infrastructure development outside of PR 2306. This type of coordination would be appropriate during rule implementation if PR 2306 is adopted.

3-d) Staff expects any change of freight rail yard ownership or operator to happen rarely, based on past observations.

3-e) Staff acknowledges the concern regarding emissions associated with ports-related rail activities. PR 2306 is part of the AQMP Facility Based Mobile Source Measures that will collectively address freight emissions in South Coast AQMD. A similar rulemaking effort is underway for ports under Proposed Rule 2304.

### **Comment PW-4 from Morgan Caswell with Port of Long Beach**

I'm providing comment today on behalf of the Port of Long Beach.

Thank you staff for the presentation. Port staff read the draft proposed regulation text dated May 17, 2024. Our primary concern is that the regulatory language is very difficult to navigate including the proposed exemption language that is specific to the cities of Long Beach and Los Angeles. The language appears to be ambiguous. It uses verbiage such as “primary” to describe the predominant function of a rail yard. How will South Coast AQMD staff evaluate the primary use of a rail yard? We also want to express concern that the definition of an “intermodal rail yard” seems very broad and could unintentionally lead to inclusion of port rail yard facilities. We appreciate that South Coast AQMD is trying to ensure that the same rail activity is not covered under two different regulations, as it would lead to many logistical challenges for responsible parties. The request is for South Coast AQMD to revise the definitions and exemption language to be clearer as to which activity is covered under PR 2306 and which is not.

#### ***Staff Response to Comment PW-4***

Please refer to staff responses to Comment Letters #6 and #7 that were subsequently submitted by the Port of Long Beach and the Port of Los Angeles, respectively, which provided further elaboration on this comment.

### **Comment PW-5 from Moses Huerta**

I am a resident from the City of Paramount. I'd like clarity on the exemption portion of the rule language. My community, we are downstream from some of the heavy activities. I want to know what would be the exemption of 30 days or less of switching activities if I am seeing rail being processed a few times a week? How many trips? If you could help me understand this. As of right now, I see rail cars being switched over and we have idling. What would be the trips per week? What is the base for this exemption? Is it a certain number of trips, or the type of movement?

#### ***Staff Response to Comment PW-5***

The low activity exemption in PR 2306 is meant for infrequently used sites that may be set up for temporary operational needs and do not operate year-round. The exemption does not apply to intermodal rail yards. For any other site to qualify for the exemption, the site cannot have switching activities occurring more than 30 calendar days per calendar year (please refer to Chapter 3 of this report for more details). Under PR 2306, a rail yard is also defined as a facility where one or more work crews are assigned to conduct day-to-day business operations. Staff welcomes any suggestions for this exemption, including any alternative metric for the exemption threshold.

### **Comment PW-6 from Thomas Jelenic with Pacific Merchant Shipping Association (PMSA)**

I want to follow up on the exemption question as well. The current discussion does not seem consistent with some of the discussions I have had with staff regarding the exemption. If the exemption would only cover who is actively regulated and not the activity, so, if you had a cut of locomotive with a cut of trains leave the port, go to Hobart, under the proposed rule, the Hobart facility would be responsible for that activity, and it is also possible for the terminal operator in a future port rule would also be responsible for that same activity even though the rail yard at the

port is not a regulated facility under this rule, but the marine terminal would be under a future port rule. Is that understanding correct? Would a marine terminal operator under a port rule not be responsible for the rail activity and the locomotive that departs their facility? My concern is during the presentation and the commenting session after the presentation, it is being described as a full exemption under this rule. When I read the proposed language, it is not a full exemption, but the activity could be captured under both rules [PR 2306 and a potential future port rule]. The exemption language in PR 2306 does not exclude the activity of locomotives that travel between regulated facilities and port terminal; it does not exclude such activity from this rule or a future ports rule. So, there is a potential for that activity, for locomotives moving between ports and non-port rail yards being captured under both rules. Currently, this activity is not excluded, correct? If it is not, characterizing this as a full exemption is ambiguous and misleading. The rule language needs to be refined and the distinction between activity and facility in the rule and how it applies needs to be made much clearer.

#### ***Staff Response to Comment PW-6***

Please refer to staff response to Comment Letter #5 that was subsequently submitted by PMSA and provided further elaboration on this comment.

#### **Comment PW-7 from Theral Golden with West Long Beach Association**

I would like clarification on the 2-year window baseline. What is the goal? Is it attainment? The goal is not clear to me.

#### ***Staff Response to Comment PW-7***

PR 2306 is designed to assist with achieving regional attainment goals, consistent with the purpose of the 2016 and 2022 Air Quality Management Plans and all of the Facility-Based Mobile Source Measures. PR 2306 defines the base period as two full calendar years either after PR 2306 becomes effective or after a new freight rail yard begins operation (please refer to Chapter 3 of this report for more details). Inclusion of base period in PR 2306 is for the operators of subject freight rail yards to provide information that supports demonstration of compliance with emission reductions requirements, and to also help track facility emissions as well as any changes and progress on zero emission infrastructure planning, development, and utilization.

#### **Comment PW-8 from Andrea Vidaurre with The People's Collective for Environmental Justice**

8-a) What are the penalties for the railyards if they do not reduce their emissions every year? Will the penalties be monetary? Or are there other levels of accountability?

8-b) Will all data be accessible to the public about the emissions at the different railyards? How soon will that be up?

#### ***Staff Response to Comment PW-8***

8-a) PR 2306 will function similarly to other South Coast AQMD rules with regards to penalties for violation of the rule or any specific rule provision. Moreover, upon approval into state implementation plan of any rule, the enforcement provisions of Federal Clean Air Act become effective as well. The term “penalties” typically refers to “civil penalties” under the Health and

Safety Code and the Federal Clean Air Act. Health and Safety Code Section 42400 sets forth the framework for monetary penalties.

8-b) Please refer to staff response to Comment PW-3-b.

### **Comment PW-9 from an anonymous attendee**

Will zero-emission efforts at railyards include plans for systems-wide support and self-sufficiency regarding electrification in order to avoid shifting strain to broadscale energy infrastructure?

#### ***Staff Response to Comment PW-9***

Please refer to staff response to Comment PW-2 in terms of fuel neutrality of PR 2306. The proposed rule requires the owner and operator of a freight rail yard to report on zero emission infrastructure planning, development, and utilization. They are also required to report on the assessment of any need to upgrade the electrical grid serving their facility. If there is a potential need for such an upgrade to the electrical system, the owner and operator will be required to submit a request to the local electrical utility to initiate the process in a timely manner. The specific design and requirements that the zero emissions infrastructure will need to meet, including whether to include what is suggested in this comment, will be determined by the rail yard owner and operator.

### **Comment PW-10 from Mark Abramowitz with Community Environmental Services**

10-a) Why is the implementation date tied to federal approval? Aren't the emission reductions required to meet state ozone standards?

10-b) Could you indicate what enforcement mechanisms are being planned, and under what timeframes? So far, the District has not taken any enforcement actions with respect to the non-compliant airport MOUs. Enforcement provisions and protocols upfront would go a long way towards ensuring that a similar situation does not occur for this rule.

10-c) I am concerned that this rule may not yield any emission reductions if CARB's estimated reductions for South Coast under the locomotive rule do occur, there is going to be a whole class of potentially reducible emission sources that are not going to be touched. I think that will be inconsistent with the AQMP, which talks about both rules being in existence and there are emission reductions associated with both of state rules for South Coast as well as for a separate South Coast rule. If all the emission reductions that we are anticipating in the CARB rule, we will be missing all the reductions that are in the AQMP. There is a state requirement that the district reduce all emissions to the extent feasible and to do it as soon as possible. I urge the district staff to look at the overall goals of the rule and not just tie it to state requirements.

#### ***Staff Response to Comment PW-10***

10-a) The Effective Date provision of PR 2306 takes into account potential federal preemption considerations, which are discussed in detail in Chapter 1 *Legal Authority* section of this report. PR 2306 will assist in attaining both state and federal standards for ozone and fine particulate matter.

10-b) Please refer to staff response to Comment PW-8-a for PR 2306 enforcement mechanisms. Enforcement of the Airport MOU is not analogous to enforcement of a rule. The specific

mechanisms for enforcing the Airport MOUs is fully contained in the MOU language itself, and that process is being followed as appropriate. For more information about South Coast AQMD's enforcement program, the commenter is referred to our enforcement webpage here: <https://www.aqmd.gov/nav/about/authority/enforcement>. In short, rule enforcement is governed by state and federal law, which differs from the Airport MOUs. If adopted, PR 2306 and PR 316.2 would be enforced similar to all other South Coast AQMD rules, including audits, inspections, with follow-up notices to comply or notices of violation as appropriate, followed by resolution of those notices, which may include monetary penalties.

10-c) PR 2306 is designed to ensure emission reductions occur at freight rail yards within the South Coast AQMD at levels that are at least commensurate with proportional implementation of recently adopted statewide regulations affecting locomotives and drayage trucks. There are no requirements in CARB's applicable regulations that would ensure the necessary emission reductions occur in South Coast AQMD, thus strengthening the State Implementation Plan. It is possible that additional emission reductions would be achieved in South Coast AQMD under PR 2306 than would occur with only existing state regulations. For example, absent PR 2306, emission reductions may occur under CARB's In-Use Locomotive and Advanced Clean Fleets regulations preferentially outside of South Coast AQMD. This same activity could potentially occur with PR 2306, however rail yard operators would need to achieve additional emission reductions equal to the shortfall from other emission sources beyond CARB regulations for those categories, such as from Transportation Refrigeration Units or Cargo Handling Equipment. For whichever option is chosen by rail yard operators, the necessary emission reductions in South Coast AQMD would be more certain with PR 2306 than without it. Further, as stated in the 2016 and 2022 AQMPs, the Facility Based Mobile Source Measures, including MOB-02 for rail yards, are meant to facilitate the state's "Further Deployment of Cleaner Technologies" strategy as part of the State Implementation Plan (SIP). No quantified emission reductions have been associated with these Facility-Based Measures in the AQMPs as it was too speculative to determine at that time. The proposed approach for PR 2306 and PR 316.2 is consistent with the feasibility and timing requirements under state law when considering all technical, legal

#### **Comment PW-11 from an anonymous attendee**

Does being "fuel neutral" take into account greenhouse gas emissions created by producing hydrogen from fossil fuels (as is almost all commercial hydrogen is produced in the world today)? For renewably generated hydrogen using electrolysis, is water and electricity consumption accounted for by South Coast AQMD?

#### ***Staff Response to Comment PW-11***

Such impacts were analyzed in the Final Program Environmental Impact Reports for the 2016 and 2022 AQMPs. Please refer to Appendix A – Detailed California Environmental Quality Act Analysis for more details.

**Comment PW-12 from an anonymous attendee**

I've heard that CARB's Advanced Clean Fleets Regulation is being challenged in court. If the ACF Regulation (or the In-Use Locomotive Regulation) gets overturned, will PR2306 still go into effect?

**Staff Response to Comment PW-12**

If adopted, PR 2306 will go into effect only after the requested authorization/waiver are granted by U.S. EPA to the CARB In-Use Locomotive Regulation and ACF Regulation (as a whole or in part for the Drayage Truck requirements). It is currently speculative to predict any impact on PR 2306 resulting from any potential, unspecified court rulings relative to the litigation challenges to the two CARB regulations, which may or may not pertain to PR 2306.

**Comment PW-13 from Al Sattler**

13-a) The presentation showed projected between 2029 and 2030 that NOx would suddenly decrease by about half. Why would that be?

13-b) With respect to the grid infrastructure update, utilities presumably would be adding it to their rate base that they could be charging their rate payors. Would that be all rate payors within the entire utility base, or would it be specifically targeted to those projects?

13-c) I would urge all locomotives and railyards and other infrastructure in the rail yards be electrified or perhaps hydrogen fuel celled.

**Staff Response to Comment PW-13**

13-a) The projected emission reductions are based on CARB's Regulatory Impact Assessments and the assumption that statewide emission reductions would occur proportionally in South Coast AQMD. Several fleet turnover projections in CARB's analysis contribute to the significant drop in NOx emissions around 2029-2030. First, CARB's In-Use Locomotive Regulation will prohibit locomotives that are 23 years old or older from operating in California beginning in 2030, unless they meet the cleanest federal locomotive standard or operate in zero emission configuration. It is therefore projected that many locomotives operating in California will be Tier 4 by then, and switch locomotives built in 2030 or later will be additionally required to operate in zero-emission configuration.<sup>147</sup> Significant turnover of the drayage truck fleet to zero emission is also projected by 2030 given that the ACF regulation requires 100 percent zero-emission drayage trucks by 2035.<sup>148</sup> This projection is consistent with, and based on, statewide projections for CARB rules. The emission reductions in this graph are also associated with Table 1 of PR 2306. If freight rail yard operators comply with PR 2306 under the option in subparagraph (d)(1)(B) of the rule, then the emission reductions may be less than what is shown in the graph, though would still be at least proportional to statewide reductions.

<sup>147</sup> Standardized Regulatory Impact Assessment for the In-Use Locomotive Regulation: <https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2022/locomotive22/appb.pdf>

<sup>148</sup> Standard Regulatory Impact Assessment Submitted to Department of Finance – Advanced Clean Fleets Regulation: <https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2022/acf22/appc.pdf>

13-b) How costs in association with electrical grid upgrades would be apportioned is not established by South Coast AQMD or PR 2306. These rates are under the purview of utilities regulators such as the California Public Utilities Commission or local publicly owned utilities such as Los Angeles Department of Water and Power.

13-c) Thank you for your comment. Please refer to staff responses to Comment PW-2 and Comment PW-9.

### **Comment PW-14 from a representative of East Yard Communities for Environmental Justice**

Can you clarify the proposed railyard compliance through “reduced throughput” option? It poses concerns to our communities for any potential loopholes from industry.

#### ***Staff Response to Comment PW-14***

Any freight rail yard, whether they have reduced throughput or not, is required to meet or exceed emission reductions targets under PR 2306. In addition to the primary pathway to demonstrate compliance as specified in paragraph (d)(2) of PR 2306, a freight rail yard with a reduced throughput may elect to demonstrate compliance differently. This alternative compliance pathway is included in recognition of the emission reductions achieved at the qualified freight rail yard due to the decrease in throughput, which may be due to economic or operational reasons. However, it does not imply that emission reductions due to reduced throughput alone are necessarily sufficient for rule compliance, as the proposed rule still requires the facility to demonstrate their facility-wide emissions from all applicable mobile sources (including locomotives, drayage trucks, and CHE, TRUs, and all other sources) meet or exceed the applicable emission reductions targets. Therefore, staff do not perceive any potential loopholes under this compliance pathway. Please refer to Chapter 3, *PR 2306 Paragraph (d)(3)*, of this report for more details.

### **Comment PW-15 from an anonymous attendee**

How much additional emission reductions is this rule expected to bring separately from state rules?

#### ***Staff Response to Comment PW-15***

Please refer to staff response to Comment PW-10-c.

### **Comment PW-16 from Paola Vargas with East Yard Communities for Environmental Justice**

To confirm, CHE and TRU will be unregulated in this rule? For example, if a freight rail yard complies with the rule with locomotives and drayage trucks, then there wouldn't be a mechanism for CHE and TRU emissions to be addressed. If compliance of the railyard doesn't include CHE and TRUs (since it is not a guarantee), will/can there be measures or mechanisms to ensure emission reductions are still coming from these sources, since they are also sources of NOx in our communities? I express concern and encourage staff to push for a mechanism to address emissions from those equipment categories due to our ozone nonattainment levels. There is concern in our communities that this is something falling short in the rule.

***Staff Response to Comment PW-16***

PR 2306 regulates freight rail yards by requiring freight rail yard operators to demonstrate sufficient NOx reductions from mobile sources attracted to their facilities. The freight rail yard operator may demonstrate compliance with PR 2306 with emission reductions from one or more mobile sources of emissions associated with its facility operations, including locomotives, drayage trucks, CHE, TRU, and other applicable mobile sources. The operator may include in its compliance demonstration emission reductions from any combination of the listed sources as long as the emission reductions targets are met or exceeded for its facility. There is no single regulation that can address all of the emission reduction requirements from goods movement facilities covered under the Facility-Based Mobile Source Measures in the 2016 and 2022 AQMPs. Additional measures will be needed to address other emission sources associated with rail yards. PR 2306 is designed to ensure that South Coast AQMD receives emission reduction benefits from statewide regulations, as part of a broader framework to reduce emissions from goods movement sources.

***Comment PW-17 from Trish Clary with Union Pacific***

I am trying to understand in a scenario where a truck TRU would go from a warehouse to a port. Who is counting what emissions? Which rule is the emissions being counted towards? It feels like there is double, potentially triple counting of those emissions. To confirm, in a scenario like this, all three facilities, the warehouse, port, and rail yard, would have to report the emissions and South Coast AQMD staff would figure out where the duplication is occurring?

***Staff Response to Comment PW-17***

PR 2306 requires a freight rail yard operator to demonstrate compliance with the proposed rule requirements by including any activities that are associated with that specific freight rail yard. Freight rail yard operators are not responsible for determining any potential ‘double counting’ as mentioned in the comment. The only activity a freight rail yard operator will need to track will be what is required under PR 2306 as described in the Rule 2306 Calculation Methodology, and they are not responsible for other facilities covered by other rules. The requirement from other rules applicable to other facilities (e.g., warehouses, ports) may differ substantially from PR 2306. For example, warehouses are not required to track TRU activity under Rule 2305. Also, any potential requirements for port facilities under PR 2304 have not yet been established as no draft rule language has been released or adopted by the South Coast AQMD Board. To the extent that any ‘double counting’ may occur across multiple regulations, staff from South Coast AQMD will evaluate and address this prior to submitting SIP credit planning requirements to U.S. EPA. This analysis is not the responsibility of a freight rail yard owner or operator under PR 2306.

***Comment PW-18 from an anonymous attendee***

Similarly, as a resident of Carson who has dealt with the smog/sulfur from nearby factories, I urge for more restrictions and real consequences on the polluting ports.

***Staff Response to Comment PW-18:***

Staff is concurrently pursuing rulemaking for PR 2304 – Commercial Marine Ports – Container Terminals to seek emission reductions from port operations.

**COMMENT LETTERS**

**Comment Letter #1 from Earthjustice et al.**

June 6, 2024

Chair Delgado & Members of the Board  
 Governing Board  
 South Coast Air Quality Management District (South Coast AQMD)  
 21865 Copley Drive  
 Diamond Bar, CA 91765  
 Email: [cob@aqmd.gov](mailto:cob@aqmd.gov)

**RE: Agenda Item 2B: Set Hearing for Proposed Rule 2306 (Freight Railyard Rule)**

Dear Chair Delgado and Members of the Governing Board:

On behalf of the undersigned organizations, we write regarding Proposed Rule 2306. After years of waiting, an indirect source rule proposal for railyards is finally coming to the Governing Board. As the years have ticked, waiting for action by the South Coast AQMD, many people have fallen ill and even died from the rail industry’s pollution. The South Coast AQMD must adopt a rail indirect source rule in August and strengthen it to provide better health protections to overburdened communities that need clean air.

Several organizations submitted a letter on May 8, 2024 (see attached) asking for strengthening the rule. The South Coast AQMD should heed these recommendations and strengthen the regulation. Given the air pollution crisis and the fact that the South Coast Air Basin is on the brink of facing federal sanctions under the Clean Air Act, now is not the time to retreat from passing the strongest possible rule to curb rail pollution.

Moreover, there is great urgency to act. Rail-adjacent communities live in a consistent and persistent localized air pollution crisis. The rail industry’s weak track record of caring about communities demonstrates it has no intention or plan to clean up its act. Instead, it reverts to fighting life-saving regulations. This is precisely the situation where we need our government agencies to lead in passing strong regulatory medicine to cut through the industry’s lethargy and lack of urgency.

//  
//

Comment  
1-1

We need you to act firmly and swiftly to provide the relief communities near railyards desperately need and deserve. We look forward to continuing to engage with the Board and staff to ensure we have the strongest protections for breathers in the South Coast Air Basin.

**Re: Proposed Rule 2306 - Freight Railyards Indirect Source Rule Draft Language**

Dear Mr. MacMillan and Dr. Shen:

The undersigned organizations write to comment on the latest draft rule for the Freight Railyard Indirect Source Review (ISR) Rule, Proposed Rule (PR) 2306. While the rule offers a framework for a strong ISR, we remain concerned that the current draft lacks the rigor needed to meet the region’s non-attainment and public health needs.

We offer these comments in the hope that staff will strengthen PR 2306 before it is finalized and brought to a vote in August.

**I. Summary of Recommendations to Improve the Rule**

As further explained in this letter, PR 2306 must be strengthened in the following specific ways:

1. The District must use its authority over stationary sources to develop more aggressive, *facility-wide*, emission reduction targets —not limited to just locomotives and trucks governed by state rules.
2. PR 2306 should eliminate unnecessary regulatory off-ramps for railyard facilities claiming reduced throughput.

Comment  
1-2

- 3. PR 2306’s infrastructure component should require commitments supporting broadscale, facility-wide, transitions to zero-emissions, not just for locomotives and trucks.
- 4. PR 2306 should require new rail yard facilities to start at zero-emissions operations.
- 5. PR 2306 should empower environmental justice communities with information access and a role in making decisions on how to best address the impact of offending facilities.

Comment  
1-2 Con't

The following sections provide our reasoning for these requests to improve the draft language.

**II. The Railyard ISR Must Set Facility-Wide Emissions Reduction Targets that Address All Health-Harming and Polluting Mobile Sources at Railyard Facilities,**

The Railyard ISR must set emissions reduction targets for railyard facilities as a whole to address the impact that entire railyard facilities have on local public health and regional nonattainment of federal and state standards. By setting emission reduction targets on the stationary source, the Railyard ISR will account for all sources of air pollution from railyards rather than arbitrarily limiting these targets to locomotives and trucks.

As currently drafted, the Rule would allow already heavily polluting railyards to merely do what they will already be mandated to do statewide and nothing else. Yet the SCAQMD has the legal authority to use the ISR to protect public health and control air pollution from stationary sources like railyards.<sup>1</sup> The Ninth Circuit has interpreted this authority as requiring emissions reductions that are “site-based” rather than “engine” or “vehicle-based.”<sup>2</sup> Utilizing this authority, PR 2306 should use a **site-based** approach to set emission-reduction targets looking at all emissions the facility draws to the region, not just locomotives and trucks.

Comment  
1-3

Railyards are major hubs of activity and significant sources of nitrogen oxides (NOx), particulate matter (PM), and other pollutants contributing to the region’s poor air quality. Several polluting mobile sources operate at these facilities, including trains, trucks, transportation refrigeration units (TRUs), and cargo handling equipment — each contributing to overall emissions (see Table

<sup>1</sup> 42 U.S.C. §7410(a)(5)(D).

<sup>2</sup> Nat’l Ass’n of Home Builders v. San Joaquin Valley Unified Air Pollution Control Dist., 627 F.3d 730, 737 (9<sup>th</sup> Cir. 2010)

Comment 1-3 Con't

The vast majority of this technology is currently powered by diesel or the combustion of other fossil fuels, which is exacerbating local poor air quality and contributing to the toxic stew that neighboring communities are forced to breathe.

PR 2306 should use the latest inventory of emissions by source type to discern the appropriate facility-wide emission-reduction targets. The Air District has clear authority to reduce emissions from stationary sources. The Railyard ISR should address facility-wide emissions, and in doing so, it will also ensure a more comprehensive approach to protecting communities from the health harms of railyards.

**III. The Railyard ISR Should Not Offer Regulatory Off-Ramps for Any Facility.**

The suggested compliance exception for reduced throughput facilities contradicts the ISR's original intent and should be removed. The District has no justification for providing this concession to heavily polluting industries, particularly when the South Coast must decrease emissions by an astounding 67 percent above current regulations and air plans to comply with the existing 70 part per billion federal ozone standard. Allowing regulatory carve-outs for any facility also undermines the shared objectives of SCAQMD, CARB, and AB 617 communities by enabling polluting facilities to maintain the status quo while avoiding any action that would help them transition to zero emissions.

Comment 1-4

As staff are aware, railyard facilities in our region have already wreaked havoc on local air quality and harmed the health of thousands living in overburdened neighboring communities. The pollution caused by railyards is a clear environmental justice issue that the District should prioritize resolving. Reduced throughput at a railyard should not result in disproportionately impacted communities being exposed to a steady stream of pollution. No facility should have the option to continue polluting without taking action to clean up their operations.

At the beginning of the rulemaking process, the staff identified the threefold purpose of the rule as follows: 1) to minimize public health impacts on surrounding environmental justice communities; 2) to ensure that projects do not interfere with federal air quality standards; and 3) to ensure that projects meet federal conformity requirements.<sup>3</sup> Now that PR 2306 will cover both new and existing railyards, the rule offers the opportunity to more comprehensively address their public health impacts and impediments to NAAQS (National Ambient Air Quality Standard) attainment. Whether a railyard has seen a shift in activity to other facilities is irrelevant as achieving these goals will require comprehensive actions to reduce pollution at every railyard, not just a subset. If a facility experiences a slowdown in operations, it should still be required to participate in coordinated infrastructure planning and take steps towards a zero-emissions transition to further reduce existing pollution and prevent future spikes as throughput returns.

Comment  
1-4 Con't

It is also unclear how the District will measure the average annual throughput for a facility to qualify for the reduced throughput option, as the draft language does not specify a metric. The only suggestion is that a facility can demonstrate reduced throughput in a milestone year preceded by two calendar years of lower throughput compared to the base period.<sup>4</sup> This compliance exemption could potentially apply to some of the heaviest polluting railyards and could perpetuate existing harm and undermine the District’s commitments to environmental justice and public health. There is no justification for this exemption, and it should be eliminated.

**IV. The Railyard ISR Should Require Facilities to Build Electric Charging Infrastructure to Support Facility-wide Transition to Zero-Emissions.**

We are pleased to see that the draft language includes an infrastructure component to support the deployment of zero-emissions technology at railyard facilities. However, the current draft misses an opportunity to catalyze a broad-scale transition to zero-emission infrastructure by only focusing on compliance with the CARB’s In-Use Locomotive and ACF rules. We urge the staff to broaden the scope of this component to include infrastructure planning and commitments that can facilitate a transition of the stationary sources to zero emissions.

Comment  
1-5

<sup>3</sup> South Coast Air Quality Management District presentation, *Proposed Rule 2306- Indirect Source Rule for New Intermodal Facilities*, (July 30, 2021), slide 24; [https://www.aqmd.gov/docs/default-source/rule-book/Proposed-Rules/pr-2306/pr2306\\_wgm\\_1\\_final.pdf?sfvrsn=10](https://www.aqmd.gov/docs/default-source/rule-book/Proposed-Rules/pr-2306/pr2306_wgm_1_final.pdf?sfvrsn=10)

<sup>4</sup> PR2306 2024 Draft Language (as of April 12, 2024), p.6; <https://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/pr2306-draft-rule-language-clean-final.pdf?sfvrsn=6>

To ensure a complete shift towards zero-emissions, a facility-wide approach to infrastructure planning is necessary. It is not just locomotives and trucks that need to be considered, as other components of railyard operations like cargo handling equipment and TRU's must also be electrified. Therefore, to address pollution sources from an entire railyard facility, we recommend that in addition to stronger emissions-reduction targets, infrastructure requirements should also focus on a facility-wide approach.

The Railyard ISR is a powerful tool that can help accelerate the development of electric charging infrastructure to move towards zero emissions. We have already seen how effective this approach can be with the District's Warehouse ISR rule, which has successfully led to infrastructure planning and the creation of custom plans, including the development of zero-emission vehicle charging stations. The Railyard ISR needs a similar approach, but not one that is arbitrarily limited to just two technology categories. By broadening the scope of infrastructure planning to cover entire railyards, the rule can better serve its purpose of delivering the cleanest technology at these facilities, as required by the 2022 Air Quality Management Plan<sup>5</sup>, by making it mandatory to have the necessary infrastructure to support it.

Comment  
1-5 Con't

To ensure that the rule is robust enough to meet the various demands of the South Coast, it should mandate operators to provide precise timelines for when they request utilities to support infrastructure installation and provide evidence that these requests were submitted. This level of detailed planning will ensure that facilities are taking the necessary steps to fulfill commitments made towards ensuring compliance.

**V. All New Railyards Should be Zero-Emissions From Day One.**

For PR 2306 to be effective, any new railyard built in the District must be zero-emissions from the start. As stated earlier, the South Coast needs to comply with federal mandates to meet the current 70 part per billion ozone standard. To achieve this, the Air District needs to reduce emissions by 67 percent more than the current regulations adopted and approved in previous air plans. The chart below shows the challenge faced by the South Coast in providing clean air to its residents. The gold dotted line represents the range of emissions reductions that must be achieved by 2037 to meet clean air standards in the South Coast Air Basin.

Comment  
1-6

According to the 2022 State Implementation Plan, even after adopting several regulations, the South Coast would still have 196 tons per day of NOx emissions in its air. To meet the federally mandated air quality standards, California estimates that it needs to reduce 124 tons per day of NOx emissions, bringing it down to a carrying capacity of 60 tons per day. This reduction is necessary to ensure a healthy environment with clean air.

<sup>5</sup> South Coast Air Quality Management District, 2022 Air Quality Management Plan, p.4-25.

**Figure 9 – South Coast Air Basin NOx Emissions under Current Control Program (emissions out to 100 nautical miles)<sup>9</sup>**

The South Coast Air Basin is in dire need to reduce emissions. Therefore, no new railyards should be allowed to add to this pollution. It is imperative that any new railyards operate with zero emissions from the beginning. Anything less would only make the federal compliance challenge even more massive, and burden communities with even more pollution.

Comment  
1-6 Con't

It is entirely possible to require new railyards to begin operations with zero-emissions locomotives. Recent analysis by the California Air Resources Board (CARB) has shown that the use of zero-emissions trains along routes with steep inclines in the Port of Los Angeles to Barstow region is not only feasible, but in some cases, even more advantageous due to the reduced number of locomotives required to complete the journey.<sup>6</sup> Studies have also demonstrated that electric rail can offer billions of dollars in cost savings due to the reduced cost of electricity compared to diesel.<sup>7</sup> The Biden Administration has also recognized the advantages of zero-emissions (ZE) locomotives, leading to the release of the first-ever national goal for a zero-emissions freight sector and the National Blueprint for Transportation Decarbonization, which recommends the broad electrification of U.S. rail.<sup>8</sup> New railyards in the South Coast region should be equipped with the necessary infrastructure for ZE operations to accommodate this technology.

<sup>6</sup> California Air Resources Board Locomotive Authorization Request to U.S. Environmental Protection Agency (April 22, 2024), Docket ID No. EPA-HQ-OAR-2023-0574, Exhibit A- ZE Locomotive Feasibility Analysis Port of LA to Barstow Report; available at: <https://www.regulations.gov/comment/EPA-HQ-OAR-2023-0574-0153>.

<sup>7</sup> Popovich, N.D., Rajagopal, D., Tasar, E. et al. Economic, environmental and grid-resilience benefits of converting diesel trains to battery-electric. *Nat Energy* 6, 1017–1025 (2021). <https://doi.org/10.1038/s41560-021-00915-5>.

<sup>8</sup> Office of Energy Efficiency & Renewable Energy, *The National Blueprint for Transportation Decarbonization: A Joint Strategy to Transform Transportation*, <https://www.energy.gov/sites/default/files/2023-01/the-us-national-blueprint-for-transportation-decarbonization.pdf>.

It is therefore counterproductive to have a two-year lag time for new railyards to demonstrate zero-emissions infrastructure planning and reporting. Instead, new railyards should be required to report on infrastructure planning at the inception, as soon as the owner has notified the District of the potential new facility for the region.

Comment  
1-6 Con't

**VI. Reporting Should be Publicly Available, and Environmental Justice Communities Should Help Decide How Harms Are Addressed.**

The District should share all reports and recordkeeping documents with the public to ensure transparency and accountability. If these documents contain private or proprietary information, the entity seeking to protect the information should provide evidence to support their claim. Entities claiming privacy can redact only the information necessary to protect their interests and make the remaining information public to ensure transparency and accountability.

Public access to monitoring and reporting data will make the Rule enforcement more effective by expanding opportunities to identify non-compliance. The current draft lacks a streamlined mechanism for the public to stay informed about changes in ownership and operation, construction of new facilities, initial reporting on facility operations and infrastructure plans, and milestone reporting on emissions reduction targets. Currently, recordkeeping data to verify reports is only available at the District's Executive Officer's request. Staff should change this in the final draft to ensure public access.

Comment  
1-7

Freight-impacted communities have demanded a Railyard ISR for a decade to address the harmful emissions from railyards. Community Emission Reduction Plans (“CERPs”) for four AB 617 communities identify the Railyard ISR, the expansion of zero-emissions infrastructure, and expanded fenceline monitoring and reporting as critical mechanisms to address the acute localized dangers these facilities pose. There is no reason to prevent the public from accessing key reports and recordkeeping data.

Finally, the District should use fines for non-compliance or failure to meet targets to create community-advised funds. The Rule should incorporate a program that allows impacted communities to have a say in how the District uses these funds to support the deployment of zero-emissions solutions and to address a railyard’s impact on public health.

***Staff Responses to Comment Letter #1:******Response to Comment 1-1***

Staff appreciates the organizations' participation in rulemaking and providing comments and feedback throughout the process, as well as assisting staff in engaging with environmental justice (EJ) communities near freight rail yards in the Basin.

***Response to Comment 1-2***

Please refer to staff responses, below, to Comment 1-3 through Comment 1-8.

***Response to Comment 1-3***

PR 2306 will assist in attaining both state and federal standards for ozone and fine particulate matter. The NO<sub>x</sub> emission reduction targets included in PR 2306 will mandate any freight rail yard subject to the proposed rule to reduce mobile source emissions associated with its operation as an indirect source, in accordance with South Coast AQMD's authority pursuant to Health and Safety Code Section 40716 (see detailed discussion in Chapter 1 *Legal Authority* section of this report). Compliance with PR 2306 is not limited to emission reductions from specific mobile sources, but from any "applicable mobile source(s)" as defined in the rule and includes all mobile sources that may be operated on or through a freight rail yard to transport or assist in transporting cargo or goods such as cargo handling equipment, drayage trucks, line haul locomotives, switch locomotives, transportation refrigeration units, and/or other on-site support equipment.

On the other hand, PR 2306 emission reduction targets are set at levels to ensure that proportional or more-than-proportional emission reductions will be achieved at facility-level in the South Coast AQMD region relative to emission reductions from implementation of statewide regulations throughout California - specifically the In-Use Locomotive and Advanced Clean Fleets regulations recently adopted by CARB. Although significant emission reductions are projected statewide, CARB regulations will not necessarily result in similar outcomes of emission reductions across the state as compared to each region's "business-as-usual" emissions, i.e., emissions without the recently adopted statewide regulations. With PR 2306, freight rail yard operators must consider how statewide compliance with CARB regulations would interplay with compliance with PR 2306. If statewide compliance with CARB regulations alone would already result in proportional or more-than-proportional emission reductions for a freight rail yard in the South Coast AQMD region, no further action would need to be taken by the operator of such freight rail yard. However, if statewide compliance with CARB regulations alone would result in less-than-proportional emission reductions for a freight rail yard in the South Coast AQMD region, its operator must then obtain and demonstrate additional emission reductions from any or any combination of "applicable mobile source(s)" in order to also comply with PR 2306.

In summary, PR 2306 will, at minimum, ensure that proportional emission reductions occur at levels commensurate with implementation of CARB regulations for freight rail yards within the South Coast AQMD. Compliance with PR 2306 could potentially result in further emission reductions from any mobile sources associated with freight rail yard operations, particularly in the event that statewide compliance with CARB regulations alone does not achieve proportional or greater emission reductions at the applicable freight rail yards as mandated by PR 2306. Please

also refer to staff response to Public Workshop Comment PW-10-c on emission reduction potential.

#### ***Response to Comment 1-4***

Staff appreciates the comment. There is no exemption in PR 2306 for freight rail yards with reduced throughput. In actuality, freight rail yards with reduced throughput are required to meet or exceed the emission reduction targets, as with other freight rail yards. Please refer to staff response to Public Workshop Comment PW-14 for more details. Moreover, the same reporting requirements on zero emission infrastructure planning, development, and utilization are also applicable to all freight rail yards, whether with reduced throughput or not.

With respect to the concern regarding shifting activities to a different freight rail yard to undermine the effectiveness of the proposed rule, even if the shifting of activities does occur, compliance with the emission reductions target requirements will mean that more emission reductions will be required to be achieved at the other freight rail yard(s) with increased level of throughput and activities. Also, the purpose of the rule has evolved during the rulemaking process. The purpose is stated explicitly in PR 2306 as: “The purpose of this rule is to reduce emissions of Nitrogen Oxides (NOx) associated with Freight Rail Yards and the mobile sources attracted to Freight Rail Yards in order to assist in meeting state and federal air quality standards for Ozone and Fine Particulate Matter, and to ensure that proportional or greater emission reductions occur in the South Coast AQMD jurisdiction from implementation of state regulations addressing Freight Rail Yard emission sources.”

Finally, PR 2306 defines throughput as “the total number of visits by Railcars that move through a Freight Rail Yard over a set period of time,” and “[a] Railcar entering a Freight Rail Yard and then leaving that yard counts as one visit.” In order to qualify for the reduced throughput compliance pathway, the operator must first satisfy conditions specified in PR 2306, including demonstrating that their facility’s average throughput over a period of three years (milestone year and its two preceding years) has indeed declined from the base period.

#### ***Response to Comment 1-5***

Staff appreciates the feedback and have added an additional requirement in the preliminary draft rule language related to electrical service upgrade requests based on such feedback. Please also refer to staff responses to Public Workshop Comments PW-2, PW-9, and PW-11 with respect to fuel neutrality for zero emission infrastructure reporting requirements of PR 2306.

PR 2306 requires freight rail yard owners and operators to specify within their initial and milestone infrastructure reports the on- and off-site zero emission infrastructure that will be needed to comply with or support the implementation of state regulations such as In-Use Locomotive and Advanced Clean Fleets, any other zero emission infrastructure requirements and initiatives, as well as control measures for TRUs and CHE in the 2022 State Strategy for the State Implementation Plan. South Coast AQMD recognizes the challenges for zero emission infrastructure development and will continue to explore all possible avenues to help address these challenges.

***Response to Comment 1-6***

Staff appreciates the recognition expressed in the comment about the magnitude of attainment challenges faced by the South Coast AQMD region, and the need to significantly reduce emissions to protect public health. Additionally, prolonged nonattainment could result in potential federal sanctions, which will negatively impact our region's highway infrastructure funding and the overall economy (please refer to Chapter 4 of this report for more details). Staff also agrees that the region's air quality challenges demand all feasible actions to be taken, and that actions need to be taken by federal, state, and local agencies utilizing our respective authorities. PR 2306 is developed by carefully considering South Coast AQMD's legal authority (please refer to Chapter 1 *Legal Authority* section of this report), and it is designed as part of the suite of AQMP Facility Based Mobile Source Measures aimed at collectively addressing emissions related to freight transportation.

Please refer to staff responses to Public Workshop Comments PW-3-a and PW-16, respectively, relative to technological feasibility for all freight rail yard sources of emissions and limitations for South Coast AQMD to regulate specific mobile sources. South Coast AQMD continues to work with technology developers and other stakeholders in the demonstration and deployment of various zero-emission mobile-source technologies.

Finally, as with other freight rail yards, the owner and operator of a new freight rail yard are required to submit an initial report not only on any planning, but also on any development and utilization of zero emission infrastructure during the base period (i.e., the first two full calendar years after the new freight rail yard begins operation). Any subsequent updates are also required to be reported for each milestone year.

***Response to Comment 1-7***

Please refer to staff response to Public Workshop Comment PW-3-b. Development of specific approaches to release information to the public from PR 2306 will be developed during rule implementation if the rule is adopted and put into effect.

With regards to any business confidential information submitted as part of PR 2306 compliance reporting, South Coast AQMD will follow the agency's *Guidelines for Implementing the California Public Records Act* in processing information that is potentially confidential. The guidelines document is available at: <https://www.aqmd.gov/docs/default-source/default-document-library/Guidelines/pr-guidelines.pdf>.

***Response to Comment 1-8***

With regards to penalties for rule violation, please refer to staff response to Public Workshop Comment PW-8-a. The use of any future potential monetary penalty payments from a violation of PR 2306 or 316.2 (if the proposed rules are adopted and become effective) will be subject to Governing Board approval.

**RE: Comments of the California Air Resources Board Regarding Proposed Rule 2306 by the South Coast Air Quality Management District**

Dear Assistant Deputy Executive Officer MacMillan:

The California Air Resources Board (CARB) recognizes the need for the South Coast Air Quality Management District (District) to achieve oxides of nitrogen (NO<sub>x</sub>) emission reductions from locomotives and other rail yard sources. The District is in extreme non-attainment for ozone and needs NO<sub>x</sub> reductions for the State Implementation Plan. Five out of six of the current Community Emission Reduction Plans in the District's most impacted areas state that reducing emissions from either rail yards or locomotives is a priority for the communities.

CARB staff are currently reviewing Proposed Rule 2306 – Freight Rail Yards (Proposed Rule) and will work with the District to address questions as they arise. CARB's review will include identification of emission reductions that will be surplus to CARB regulations, potential impacts to other areas of the State, and potential changes in operator behavior created by the Proposed Rule.

CARB appreciates the opportunity to comment on the Proposed Rule to the District. We look forward to continuing to work with you in creating an enforceable Rule.

Sincerely,

A handwritten signature in blue ink, appearing to read "Heather Arias".

Heather Arias, Chief, Transportation and Toxics Division

cc: Steven S. Cliff, Ph.D., Executive Officer, California Air Resources Board  
Edie Chang, Deputy Executive Officer, Planning, Freight and Toxics

Comment  
2-1

***Staff Response to Comment Letter #2:******Response to Comment 2-1***

Staff appreciates continued partnerships with CARB, including but not limited to CARB's feedback on PR 2306, in addressing South Coast AQMD's attainment needs and mitigation of the impacts of rail yard emissions on South Coast AQMD's EJ communities. With respect to emission reductions surplus of CARB regulations, please refer to staff's response to Public Workshop Comment PW-10-c. With respect to potential impacts of PR 2306 to other areas of the state, please refer to staff responses to Public Workshop Comments PW-1 and PW-10-c. Staff welcomes opportunities for further discussion on these responses, any further comment related to operator behavior, and any additional topics of interest.

### Comment Letter #3 from the Association of American Railroads and the American Short Line and Regional Railroad Association

ASSOCIATION OF AMERICAN RAILROADS

American Short Line and Regional Railroad Association

June 18, 2024

*Sent via Electronic Mail Only*

Mr. Ian McMillan  
Assistant Deputy, Executive Officer  
South Coast Air Resource Board  
imacmillan@aqmd.gov

Dear Mr. McMillan:

This month the South Coast Air Quality Management District (“SCAQMD”) held a public workshop on June 4, 2024, to discuss Proposed Rules 2306 and 316.2 (“Proposed Rules”), and proposed the draft regulatory package. See [https://www.aqmd.gov/docs/default-source/rule-book/Proposed-Rules/pr-2306/pdsr\\_pr2306-public-release-final.pdf?sfvrsn=2/](https://www.aqmd.gov/docs/default-source/rule-book/Proposed-Rules/pr-2306/pdsr_pr2306-public-release-final.pdf?sfvrsn=2/). SCAQMD relies on authority granted to it under AB 617, governing Community Emissions Reduction Plans (“CERPs”), in promulgating this regulation. The Proposed Rules apply to owners and operators of proposed, new, and existing freight rail yards within the air district, and also propose fees associated with the implementation of PR 2306.

Comment  
3-1

Although staff have requested public comment on the Proposed Rules by June 18, 2024, the draft documentation lacks adequate detail and supporting information to enable meaningful comment. As a result, today we provide limited comments focusing on the adequacy of the California Environmental Quality Act (“CEQA”) analysis as applied to PR 2306. We look forward to reviewing and commenting on the formal and complete regulatory package when publicly available.

#### The 2016 and 2022 ACMPs Fail to Meet the Standards Required By CEQA.

CEQA requires the preparation of an environmental impact report (“EIR”) in order “to identify the significant effects on the environment of a project, to identify alternatives to the project, and to indicate the manner in which those significant effects can be mitigated or avoided.” Cal. Pub. Res. Code (“PRC”), § 21002.1; see also 14 Cal. Code Regs. (“CEQA Guidelines”) §§ 15000-15387. The primary purpose of CEQA is to require state agencies to consider and disclose to the public the environmental implications of their actions, to foster an informed and transparent public decision-making process. For the reasons explained below, the 2016 and 2022 Air Quality Management Plans (“the AQMPs”), on which SCAQMD relies to establish compliance with CEQA, fail to adequately evaluate the impacts of the Proposed Rule. This is hardly surprising since the AQMPs were prepared years before the Proposed Rules were finalized.

Comment  
3-2

While CEQA sometimes allows an agency to rely on a Programmatic EIR (“PEIR”) to satisfy its statutorily mandated environmental review obligations, those situations are limited. Notably, it is the substance and details of PEIRs that dictate overall compliance with CEQA. *See, e.g., Citizens for a Sustainable Treasure Island v. San Francisco*, 227 Cal. App. 4th 1036 (2014).

In its draft Staff Report (“Draft Report”), SCAQMD asserts that “PR 2306 is a later activity within the scope of the programs approved earlier in the 2022 [ ] AQMP and 2016 AQMP[.]” *See* Draft Staff Report at 4-17. The Draft Report further states that the prior AQMPs “adequately describe the activities associated with implementing PR 2306 such that no new environmental document will be required.” *Id.* While the supporting analysis for this conclusion is not yet available, we write to express our position that it is inappropriate for SCAQMD to rely on the prior AQMPs in support of PR 2306.

Comment  
3-2 Con't

The fundamental purpose of an EIR is “to provide public agencies and the public in general with detailed information about the effect which a proposed project is likely to have on the environment.” PRC § 21061. To that end, the EIR “shall include a *detailed statement* setting forth . . . [a]ll significant effects on the environment of the proposed project.” PRC § 21100, subd. (b)(1) (emphasis added).

The AQMPs rely heavily on the introduction and expansion of infrastructure to meet the specified air quality goals and NOx emissions reduction targets. However, there is no ACMP PIER Electrical Section (4.3) regarding how much new electricity would be needed for mobile and other sources operating within freight railyards. Also, the electricity that may be needed for the indirect sources that operate within the SCAQMD and that would be attracted or travelled to individual freight railyards (e.g., trains that are electrified via catenary that travel from the SCAQMD borders to the individual FRYs) was not considered.

Comment  
3-3

In addition, the SCAQMD staff has estimated the PR 2306 NOx emissions reductions – on average annually – at about nine (9) tons per day between rule implementation (approximately 2027) through 2050. The 2022 AQMP PEIR (November 2022) was unable to estimate the potential emission reductions and indicated that was yet to be determined. But a PEIR must clearly and separately identify potential impacts and mitigation measures. Those mitigation measures must be “discussed separately and the reasons for choosing one over the others should be stated.” *Sacramento Old City Assn. v. City Council*, 229 Cal. App. 3d 1011, 1027 (1991). SCAQMD has failed to undertake that analysis here with respect to railyards.

Comment  
3-4

Finally, the 2022 AQMP PEIR Electrical Section (4.3) assesses future electricity needs, broadly indicating there would be an increase in electricity demand beyond then-current estimated growth projections. The Electrical Section of the Draft Report in support of the Proposed Rules estimates the specific increases in electrical demand for the Ports of Los Angeles and Long Beach to be approximately 100 MW to 300 MW. But it failed to account for freight railyards and the indirect sources they attract within the SCAQMD. Even absent these sources, the Draft Report concludes that the potential increase in electricity usage quantified would exceed baseline electricity consumption at the Ports by up to 11 percent. Further, even

Comment  
3-5

after mitigation measures are applied, electricity demand impacts would remain significant. However, no mitigation associated with this increase is discussed in detail. This analysis fails to fulfill SCAQMD’s obligations under CEQA.

Comment  
3-5 Con't

For the reasons identified above, we ask that SCQAMD staff reconsider its determination that a detailed and complete CEQA is unnecessary for the Proposed Rule and allow the public and regulated entities – including railroads – to consider and comment on a complete EIR, as the statute requires.

### *Staff Response to Comment Letter #3:*

#### ***Response to Comment 3-1***

Staff appreciates the stakeholder’s input and feedback on the Preliminary Draft Staff Report for PR 2306 and PR 316.2. The commenter’s claim that PR 2306 is reliant upon authority granted to South Coast AQMD under AB 617 is incorrect. The commenter is referred to the Chapter 1 *Legal Authority* section of this report for a description of South Coast AQMD authority related to PRs 2306 and 316.2. The commenter also claims that the draft documentation lacks adequate detail and supporting information to enable meaningful comment, but does not specify what kind of information is lacking. This comment is vague and unsubstantiated. The preliminary draft staff report included a background of the rule, the rationale for regulating the affected industry or sources in the manner proposed by the rule, the potential impacts of the proposed rule on the affected industry or sources, potential emission reductions expected from the rule, a description of control technologies and alternatives, draft findings of necessity, authority, clarity, consistency, and non-duplication, as well as references relied upon for the analysis. The full preliminary draft rule language was also made available, along with a detailed Calculation Methodology, an associated data appendix for the Calculation Methodology, and supplementary information on fee rates proposed in PR 316.2

The Preliminary Draft Staff Report also described South Coast AQMD’s intent and approach to the California Environmental Quality Act (CEQA) analysis for the proposed rules. A detailed environmental analysis has been prepared and is now available for review in this Staff Report, Appendix A – Detailed CEQA Analysis.

#### ***Response to Comment 3-2***

PR 2306 is a new rule which is designed to memorialize and implement Control Measures MOB-02A and MOB-02B which were previously adopted in the 2022 AQMP and Control Measure MOB-02 which was previously adopted in the 2016 AQMP. The environmental impacts of the 2022 AQMP and all of its control measures, including Control Measures MOB-02A and MOB-02B, were evaluated in a Final Program Environmental Impact Report (EIR) which was certified by the South Coast AQMD Governing Board on December 2, 2022. Similarly, the environmental impacts of the 2016 AQMP and all of its control measures, including Control Measure MOB-02, were evaluated in a Final Program EIR which was certified by the South Coast AQMD Governing Board on March 3, 2017.

CEQA Guidelines Section 15187 requires South Coast AQMD to perform an environmental analysis when proposing to adopt a new rule or regulation requiring the installation of air pollution control equipment, or establishing a performance standard, which is the case with PR 2306. CEQA Guidelines 15187(c) requires the environmental analysis to include at least the following information:

- An analysis of reasonably foreseeable environmental impacts of the methods of compliance;
- An analysis of reasonably foreseeable mitigation measures relating to those environmental impacts; and

- An analysis of reasonably foreseeable alternative means of compliance with the rule or regulation, which would avoid or eliminate the identified environmental impacts.

In analyzing the potential environmental impacts of PR 2306 as required by CEQA Guidelines Section 15187, South Coast AQMD finds that, pursuant to CEQA Guidelines Section 15162, that PR 2306 does not contain new information of substantial importance which was not known and could not have been known at the time of certification of: 1) Final Program EIR for the 2022 AQMP; and 2) the Final Program EIR for the 2016 AQMP. [CEQA Guidelines Section 15162(a)(3)]. Therefore, a Subsequent EIR is not required.

Instead, a detailed environmental analysis as required by CEQA Guidelines Section 15187 has been provided in Appendix A of this Staff Report which examines whether PR 2306 qualifies as a later activity within the scope of the previous analyses conducted in the certified Final Program EIRs for the 2022 AQMP and the 2016 AQMP pursuant to CEQA Guidelines 15168(c) – Use with Later Activities. Specifically, Appendix A: 1) compares the proposed later activity of PR 2306 with the previously approved programs, Control Measures MOB-02A and MOB-02B which were adopted in the 2022 AQMP and Control Measure MOB-02 which was adopted in the 2016 AQMP; 2) summarizes the environmental impacts analyzed in the Final Program EIRs for the 2022 AQMP and 2016 AQMP for Control Measures MOB-02A, MOB-02B, and MOB-02; 3) identifies the differences, if any, between the analyses of environmental impacts in the Final Program EIRs for 2022 AQMP and 2016 AQMP for the applicable control measures and PR 2306 and, as needed, identifies any other impact areas which may require further analysis; and 4) considers the evidence and determines whether: a) PR 2306 is a later activity within the scope of the programs approved earlier for the 2022 AQMP and 2016 AQMP; and b) the Final Program EIRs for the 2022 AQMP and the 2016 AQMP adequately describe the later activity of PR 2306 for the purposes of CEQA such that no new environmental document will be required.

The analysis in Appendix A determined that the physical changes expected as a result of implementing PR 2306 are the same as those contemplated for Control Measures MOB-02A and MOB-02B of the 2022 AQMP and Control Measure MOB-02 of the 2016 AQMP which were analyzed under the Final Program EIR for the 2022 AQMP and Final Program EIR for the 2016 AQMP, respectively.

Owners or operators of the freight rail yards that will be subject to PR 2306 have not provided site-specific details regarding any additional potential modifications and associated environmental impacts that could potentially occur at individual freight rail yard locations to comply with PR 2306 beyond what has been previously forecasted and analyzed in accordance with CEQA Guidelines Section 15144 in the Final Program EIRs for the 2022 AQMP and 2016 AQMP. Please see Appendix A: Detailed CEQA Analysis which summarizes the prior environmental analyses conducted in the Final Program EIRs for the 2022 AQMP and 2016 AQMP and demonstrates that PR 2306 constitutes a later activity of these previously approved programs (i.e., 2022 AQMP and 2016 AQMP) under CEQA Guidelines Section 15168(c)(3).

### ***Response to Comment 3-3***

Both the Final Program EIR for the 2022 AQMP and the Final Program EIR for the 2016 AQMP analyzed potential infrastructure and electricity needs associated with zero emission equipment relying on electricity to operate at freight rail yards and the utilities producing additional electricity

to satisfy increased demand. Control Measures MOB-02A and MOB-02B were analyzed in Final Program EIR for the 2022 AQMP which specifically identified energy impacts (e.g., increased demand for electricity (for vehicles, rail, and equipment) and natural gas associated with infrastructure development required to achieve emission reductions at existing rail yards and intermodal facilities from on-road heavy-duty vehicles, off-road equipment, and locomotives. Table A-9 in Appendix A provides a summary of the electricity use estimates that were conducted in the Final Program EIR for the 2022 AQMP. The estimates show that vehicles affected by Control Measures MOB-02A and MOB-02B contribute to an estimated increase of Basin-wide annual electricity use by 160.5 gigawatt hours (GWh) per year. The Final Program EIR for the 2022 AQMP concluded that implementation of 2022 AQMP control measures (including but not limited to mobile sources) would increase total Basin-wide electricity demand 11 percent over 2020 consumption but the overall potential increase in electricity demand could be higher. Because the energy impacts from implementing the 2022 AQMP were expected to be significant for electricity demand, feasible mitigation measures E-1 to E-7 for reducing impacts related to potential electricity demand were adopted the Final Program EIR for the 2022 AQMP (see pp. 4.3-21 to 4.3-22 of the Final Program EIR for the 2022 AQMP). Even after mitigation measures E-1 to E-7 were applied, electricity demand impacts would remain significant.

Similarly, Control Measure MOB-02 was analyzed in the Final Program EIR for the 2016 AQMP which also identified energy (electrical/natural gas demand) associated with constructing the necessary infrastructure to provide support for new cleaner equipment or vehicles and accelerating the penetration of zero and near-zero emission locomotives. The Final Program EIR for the 2016 AQMP similarly anticipated that the mobile source control measures in the 2016 AQMP, including Control Measure MOB-02, would increase the electricity demand in the Basin, and the analysis relied on Basin-wide electricity use to evaluate the potential energy impacts from electricity demand. The anticipated shift of cars, trucks, off-road vehicles, and marine vessels from gasoline and diesel fuels to electricity was projected to create an additional electrical load demand. Because the energy impacts from implementing the 2016 AQMP were expected to be significant for electricity demand, feasible mitigation measures E-1 to E-7 for reducing impacts related to potential electricity demand were adopted the Final Program EIR for the 2016 AQMP (see pp. 4.2-24 of the Final Program EIR for the 2016 AQMP). Even after mitigation measures E-1 to E-7 were applied, electricity demand impacts would remain significant.

In addition, it is important to note that PR 2306 is intended to supplement, but not duplicate, the local implementation of CARB's In-Use Locomotive and Advanced Clean Fleets Regulations within South Coast AQMD by requiring all freight rail yards to meet set emission reductions targets for milestone years. Moreover, as part of regulatory development and adoption process, CARB examined the environmental impacts associated with implementing each regulation by preparing CEQA documents which evaluated all of the environmental topic areas in Appendix G of the CEQA Guidelines, including energy. Specifically, on April 27, 2023, CARB certified a Final Environmental Analysis (State Clearinghouse No. 2022090408)<sup>149</sup> which examined the environmental impacts associated with implementing the In-Use Locomotive Regulation. Similarly, on August 28, 2023, CARB certified a Final Environmental Analysis (State

---

<sup>149</sup>CARB, 2023. Final Environmental Analysis for the Proposed In-Use Locomotive Regulation, April 14, 2023

Clearinghouse No. 2021030340) which examined the environmental impacts associated with implementing the Advanced Clean Fleets Regulation.<sup>150</sup>

The CEQA analysis for PR 2306 is not required to repeat or duplicate the environmental analyses previously conducted by CARB for these two adopted regulations. Instead, Appendix A incorporates these documents by reference in accordance with CEQA Guidelines Section 15150. Lastly, after CARB adopted their In-Use Locomotive and Advanced Clean Fleets Regulations, CARB published a detailed Fact Sheet “Yes, the California grid can handle electrification of all switchers in all railyards” which analyzes the energy and power requirements of locomotives (and a cruise ship at berth), and California grid capacity. The results indicated that if all switchers in California were battery electric and charged by the grid, they will account for about 0.1 to 0.2 percent of the 2022 California grid capacity.<sup>151</sup> CARB’s analysis concluded that, “In terms of power, energy, and land requirements, challenges of charging infrastructure for battery electric switchers are small compared to the current infrastructure capacity.” However, according to CARB’s analysis in their Technical Support Document on Zero Emission Conversions in Appendix C of CARB’s In-Use Locomotive Regulation<sup>152</sup>, which provides further discussion on the potential conversion of existing diesel locomotives to zero emission locomotives, zero emission line haul locomotives are expected to rely mainly on hydrogen fuel cells as the primary energy source instead of battery electric locomotives being recharged from the grid and/or local power generation. Thus, the actual electrical demand for zero emission locomotive conversions may be less than CARB’s initial projections. CARB has indicated that Appendix C is an introduction to the topic of zero emission conversions and that a more detailed technical analysis will be conducted in technical assessment which is scheduled for 2027.

### ***Response to Comment 3-4***

Both the 2022 AQMP and the 2016 AQMP provided estimates for NOx emission reductions which reflected the best information available at the time. The Final Program EIR for the 2022 AQMP concluded that the implementation of all of the control measures in the 2022 AQMP would result in an overall reduction in NOx emissions over the long-term (an environmental benefit) but with potentially significant secondary impacts for the following environmental topic areas: air quality and greenhouse gas (GHG) emissions, energy, hazards and hazardous materials, hydrology and water quality, noise, and solid and hazardous waste. Specific to the implementation of Control Measures MOB-02A and MOB-02B, the Final Program EIR for the 2022 AQMP analyzed and concluded potentially significant impacts to the environmental topic areas of air quality from construction, energy, hazards and hazardous materials, noise, and solid and hazardous waste.

In addition, the Final Program EIR for the 2016 AQMP concluded that the implementation of all of the control measures in the 2016 AQMP would result in an overall reduction in NOx emissions

---

<sup>150</sup> CARB, 2023. Final Environmental Analysis for the Proposed Advanced Clean Fleets Regulation, April 23, 2023.

<sup>151</sup> CARB, 2023. Fact Sheet “Yes, the California grid can handle electrification of all switchers in all railyards.” Published June 28, 2023, <https://ww2.arb.ca.gov/resources/fact-sheets/yes-california-grid-can-handle-electrification-all-switchers-all-railyards>.

<sup>152</sup> CARB, 2023. In-Use Locomotive Regulation, Appendix C: Technical Support Document: Zero Emission Locomotive Conversion, March 1, 2023, pp. 12-13, <https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2022/locomotive22/15dayappc.pdf>.

over the long-term (an environmental benefit) but with potentially significant secondary impacts for the following environmental topic areas: aesthetics, air quality and greenhouse gas emissions, energy, hazards and hazardous materials, hydrology and water quality, noise, solid and hazardous waste, and transportation and traffic. Specific to the implementation of Control Measures MOB-02, the Final Program EIR for the 2016 AQMP analyzed and concluded potentially significant impacts to the environmental topic areas of air quality from construction, energy, noise, and solid and hazardous waste.

CEQA requires that feasible mitigation measures be applied to reduce or eliminate potentially significant impacts and the Final Program EIRs for the 2022 AQMP and 2016 AQMP adopted a suite of feasible mitigation measures for the topics of construction air quality, energy, noise, and solid and hazardous waste. In addition, Mitigation, Monitoring and Reporting Plans were prepared and adopted with the Final Program EIRs for the 2022 AQMP and the 2016 AQMP pursuant to Public Resources Code Section 21081.6 and CEQA Guidelines Section 15097.

Appendix A of this report contains a section which is dedicated to summarizing these environmental topic areas concluded in the Final Program EIRs for the 2022 AQMP and 2016 AQMP to have significant impacts. For every topic area identified as having significant impacts, a summary of the mitigation measures that were adopted in Final Program EIRs for the 2022 AQMP and 2016 AQMP is also provided.

Finally, Table 3-5 of the Draft Staff Report provides updated estimated NO<sub>x</sub> emission reductions that are projected to be achieved by South Coast AQMD implementing PR 2306 plus CARB implementing their In-Use Locomotive and Advanced Clean Fleets Regulations. While these estimates contain updated information relative to what was presented previously, the estimates of NO<sub>x</sub> emission reductions presented in Table 3-5 do not change the previously conducted analyses and conclusion of adverse environmental impacts in South Coast AQMD's Final Program EIRs for the 2022 AQMP and 2016 AQMP or CARB's Final Environmental Analyses for the In-Use Locomotive and Advanced Clean Fleets Regulations.

#### *Response to Comment 3-5*

The Final Program EIR for the 2022 AQMP estimated an increase of approximately 11 percent over 2020 consumption of electricity in the Basin, and also indicated that this estimate did not take into account the electricity that may be needed to operate additional air pollution control equipment or to convert combustion equipment to fully electric. Thus, the analysis acknowledged that the overall potential increase in electricity demand could be higher. This increase, along with the increases in electricity associated with other state programs and mandates, was expected to exceed the electrical generating capacity of the system.

In addition, the Final Program EIRs for the 2022 AQMP and 2016 AQMP acknowledged and analyzed the potential electricity impacts associated with infrastructure and operation of indirect sources such as on-road heavy-duty vehicles, off-road equipment, and locomotives associated with implementing Control Measures MOB-02A and MOB-02B from the 2022 AQMP and Control Measure MOB-02 from the 2016 AQMP.

Because the energy impacts from implementing the 2022 AQMP were expected to be significant for electricity demand, feasible mitigation measures E-1 to E-7 for reducing impacts related to potential electricity demand were adopted in the Final Program EIR for the 2022 AQMP.

Similarly, because the energy impacts from implementing the 2016 AQMP were expected to be significant for electricity demand, feasible mitigation measures E-1 to E-7 for reducing impacts related to potential electricity demand were adopted in the Final Program EIR for the 2016 AQMP. Please also see Response to Comment 3-3.

Regarding the comment suggesting that an EIR needs to be prepared, please see Response to Comment 3-2.

## Comment Letter #4 from the Coalition for Clean Air

June 17th, 2021

Members of the Governing Board  
 South Coast Air Quality Management District (SCAQMD)  
 21865 Copley Drive  
 Diamond Bar CA 91765

### **Re: Support for strengthening and adopting Proposed Rules 2306 and 316.2 (Freight Rail Yards Indirect Source Review Rule)**

Dear Chair Delgado and members of the SCAQMD Governing Board,

The Coalition for Clean Air supports the final approval of Rules 2306 and 316.2 the Freight Rail Yards Indirect Source Review (ISR) rule. While the rulemaking for this began in earnest in 2017, the need to address rail yard pollution stretches back over a century. The South Coast Air Basin’s persistent extreme nonattainment of the National Ambient Air Quality Standards (NAAQS), a threat of federal sanctions, and the enactment of 2017’s AB 617 stress the need for emission reductions from the goods movement sector. Passing a robust ISR for rail yards will help the South Coast basin achieve a reduction in smog-forming nitrogen oxides of 9 tons per day--almost 10% of what is required to meet the 1997 standard for ozone.<sup>1</sup>

Comment  
4-1

While we support the approval of Rules 2306 and 316.2, we urge the South Coast Air Management District (“the District”) to implement the strongest rule possible. Basing the rule off of proportional California Air Resources Board (CARB) compliance is a good start, however, we would prefer to see a rule that goes above and beyond CARB’s rules. A strong rule would include emissions targets from all sources of emissions that rail yards attract--including cargo handling equipment and transportation refrigerated units (TRUs)--and go beyond compliance with CARB’s In-Use Locomotive and Advanced Clean Fleet rules.

Comment  
4-2

The air district has legal authority to implement these rules and has been given such by Congress in 1977 and confirmed in the 9th Circuit Court of Appeals in 2010. South Coast’s own counsel believes that it has the authority to act in this manner (see, “Office of General Counsel Memorandum” including as addendum). South Coast AQMD has successfully adopted PR 2305, the Warehouse ISR Rule, in 2021 and the San Joaquin Air Pollution Control District adopted an ISR in 2005, both of which have given the market the strong signal it needs to adequately clean up air pollution associated with warehouses and new development.

<sup>1</sup> <https://www.latimes.com/environment/story/2024-02-04/epa-poised-to-reject-southern-california-smog-plan>

Now is the perfect time to implement such a rule. The Federal Transit Administration, which analyzes the physical health of transit capital around the country has determined that 43% of California’s transit capital assets--including rail--are at or past their useful life. Operating a train beyond its useful life of 25 years can lead to equipment failure. With the average age of California’s rail fleet at 24 years, now is the perfect time for railroads to invest in new zero emissions equipment—ensuring the safe and reliable movement of goods.<sup>2</sup>

Comment  
4-3

To pass a robust rule, we believe PR 2306 must be strengthened in the following specific ways:

**I. The District must use its authority over stationary sources to develop more aggressive, facility-wide, emission reduction targets —not limited to just locomotives and trucks as governed by state rules.**

Emissions reductions targets should be set for rail yard facilities as a whole to address the entire impact that rail yard facilities have on local public health--including impacts from pollution and noise--and regional nonattainment of federal and state standards. An Indirect Source Review rule should account for all pollution attributed to the stationary source, i.e. the rail yard--rather than exclusively on emissions from locomotives and trucks, with other emission sources being an optional “sprinkle” of emissions reduction benefits. The current ISR will only require the rail yards to do what is already mandated by statewide rules and nothing else. The Ninth Circuit has interpreted this authority as requiring emissions reductions that are “site-based” rather than “engine” or “vehicle-based.” PR 2306 should use a site-based approach to set emission-reduction targets looking at all emissions the facility draws to the region. Rail yards are major hubs of activity and significant sources of nitrogen oxides (NOx), particulate matter (PM), and other pollutants contributing to the region’s poor air quality. Polluting mobile sources operating at these facilities, including trains, trucks, TRUs, and cargo handling equipment, each contribute to overall facility emissions. PR 2306 can use the latest inventory of emissions by source type to discern the appropriate facility-wide emission-reduction targets.

Comment  
4-4

**II. PR 2306 should eliminate unnecessary regulatory off-ramps for rail yard facilities claiming reduced throughput.**

The suggested compliance exemption for reduced throughput facilities contradicts the ISR’s original intent and should be removed. Allowing regulatory carve-outs for any facility undermines the objectives of SCAQMD, CARB, and AB 617 communities by enabling rail yards to maintain the status quo, while avoiding any action that would help them transition to zero emissions. No facility should have the option to continue polluting without taking action to clean up their operations. A comprehensive, coordinated effort across all rail yards in the District is necessary to achieve pollution reduction, even if activity shifts between facilities at any given time. It is also unclear how the District would measure the average annual throughput for a facility to qualify for the reduced throughput option, as the draft language does not specify a metric. The only suggestion is that a facility can demonstrate reduced throughput in a milestone year preceded by two calendar years of lower throughput compared to the base period.<sup>3</sup> This compliance exemption could potentially apply to some of the heaviest polluting rail yards and could

Comment  
4-5

<sup>2</sup> <https://www.lao.ca.gov/Publications/Report/3860>

<sup>3</sup> PROPOSED RULE 2306 FREIGHT RAIL YARDS “Second Draft Preliminary Rule Language.” aqmd.gov/docs/default-source/planning/fbmsm-docs/pr2306-draft-rule-language-clean-final.pdf?sfvrsn=6. Accessed 13 June 2024. Page 6

perpetuate existing harm and undermine the District’s commitments to environmental justice and public health. There is no justification for this exemption, and it should be eliminated.

Comment  
4-5 Con't

**III. PR 2306’s infrastructure component should require commitments supporting a facility-wide transition to zero-emissions.**

Rail yards should each have infrastructure plans in place for how they will reach zero-emissions goals, what load is required, and how much renewable energy they can install to reduce impacts to the grid, in collaboration with their utility provider. Infrastructure requirements should be focused on a facility-wide approach, considering other energy demands from cargo-handling equipment, trucks and TRUs. The rail yard ISR is a powerful tool to accelerate the development of electric charging infrastructure. The District’s Warehouse ISR rule has successfully led to infrastructure planning and the creation of custom plans, including the development of zero-emission vehicle charging stations and localized renewable energy installations. The rule should mandate operators to provide precise timelines for when they request utilities to support infrastructure installation and provide evidence that these requests were submitted.

Comment  
4-6

**IV. The rail yard ISR Should Require Facilities to Build Infrastructure to Support Facility-wide Transition to Zero-Emissions.**

We are glad to see that the draft language includes an infrastructure component to support the deployment of zero-emissions technology at rail yard facilities. The current draft must do more to catalyze a broad-scale transition to zero-emission infrastructure. We urge the staff to broaden the scope of this component to include infrastructure planning and commitments that can facilitate a transition of the stationary source to zero emissions, including possible on-site deployment of renewable energy.

Comment  
4-7

**V. PR 2306 should require new rail yard facilities to start at zero-emissions operations.**

With current technology available and with the milestones as suggested by PR 2306 there should be adequate time for new rail yards to comply fully with a zero-emissions operation. State law requires the district to implement all feasible measures to meet air quality standards. Thanks to technological advancements, it is now possible to have a zero-emission rail yard. With federal sanctions for non-attainment already a possibility, new rail yards should not add to our existing pollution burden. South Coast needs to comply with federal mandates to meet the current 70 part per billion ozone standard. To achieve this, the District needs to reduce emissions by 67 percent more than the current regulations adopted and approved in previous plans. Proven technologies such as catenary, third rail, and non-locomotive electric-battery train systems should be considered. Analysis by the California Air Resources Board (CARB) and the Biden Administration, through its National Blueprint for Transportation Decarbonization, show that transition to zero emissions rail is both technologically and economically feasible and also necessary for public health and to address our carbon emissions.<sup>4 5</sup> It is counterproductive to have a two-year lag time for new rail yards to demonstrate zero-emissions

Comment  
4-8

<sup>4</sup> California Air Resources Board Locomotive Authorization Request to U.S. Environmental Protection Agency (April 22, 2024), Docket ID No. EPA-HQ-OAR-2023-0574, Exhibit A- ZE Locomotive Feasibility Analysis Port of LA to Barstow Report; available at: <https://www.regulations.gov/comment/EPA-HQ-OAR-2023-0574-0153>.

<sup>5</sup> Office of Energy Efficiency & Renewable Energy, The National Blueprint for Transportation Decarbonization: A Joint Strategy to Transform Transportation, <https://www.energy.gov/sites/default/files/2023-01/the-us-nationalblueprint-for-transportation-decarbonization.pdf>.

infrastructure planning and reporting. Instead, new rail yards should be required to report on infrastructure planning at the inception, as soon as the owner has notified the District of the potential new facility for the region.

Comment  
4-8 Con't

**VI. PR 2306 should empower environmental justice communities with information access, including emissions reporting, and a role in making decisions on how to best address the impact of offending facilities.**

The District should share all reports and recordkeeping documents with the public to ensure transparency and accountability. Public access to monitoring and reporting data will make enforcement of the rule more effective by expanding opportunities to identify non-compliance. Using CalEnviroScreen or another trusted and accessible software for data sharing would be invaluable. If these documents contain private or proprietary information, the entity seeking to protect the information should provide evidence to support their claim. As required under the California Public Records Act, the district can redact the information necessary to protect confidential business information and make the remaining information public to ensure transparency and accountability. The public should be informed about changes in ownership and operations, construction of new facilities, infrastructure plans, and milestone reporting on emissions reduction targets, and have access to key reports and recordkeeping. Community Emission Reduction Plans (“CERPs”) for four AB 617 communities identify the rail yard ISR, the expansion of zero-emissions infrastructure, and expanded fence-line monitoring and reporting as critical mechanisms to address the acute localized dangers these facilities pose. If facilities are in non-compliance there should be clear pathways for enforcement.

Comment  
4-9

The District should use fines for non-compliance or failure to meet targets to create community-advised funds. The Rule should incorporate a program that allows impacted communities to have a say in how the District uses these funds to support the deployment of zero-emissions solutions and to address a rail yard’s impact on public health.

The Freight Rail Yard ISR, along with all Facility-Based Mobile Source Measurements, are important tools for cleaning Southern California’s air. SCAQMD’s analysis projects the ISR’s health benefits alone will result in up to 275 fewer deaths and 1,940 fewer emergency department visits and hospital admissions avoided per year. These public health benefits, coupled with the need to meet state and federal air quality standards for Ozone and Fine Particulate Matter, indicates a compelling reason for the board to pass the Freight Rail Yards ISR. The District has the legal authority to adopt these rules and can do so with more stringency than other state or federal agencies because it experiences greater proportionality of impacts. Protecting the health of our local community should be enough of a reason to pass the strongest rule possible.

Comment  
4-10

Sincerely,

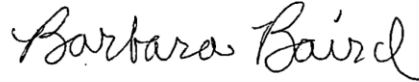

Dori Chandler  
Policy Advocate

Ian McMillan, Planning and Rules Manager, SCAQMD

**OFFICE OF GENERAL COUNSEL  
MEMORANDUM**

**To:** Dr. William A. Burke, Chairman  
SCAQMD Governing Board Members

**From:** Barbara Baird, Chief Deputy Counsel

**Re:** Authority to Adopt Indirect Source Rule for Railyards

**Date:** March 19, 2018

***Introduction***

At the March 2, 2018, Governing Board Meeting, during public comment on the Facility Based Mobile Source Measures item, (Agenda Item 32) a representative of the freight railroads commented that they believed the SCAQMD lacked authority to adopt an indirect source rule for railyards. The railroads have also commented on the AQMP that such a rule would in any event be preempted. A Governing Board member asked for staff's response to this comment. This memo provides such a response.<sup>1</sup>

***Issue 1: Authority***

The SCAQMD has authority to adopt rules to reduce or mitigate emissions from indirect sources (Health & Saf. Code Sec. 40716(a)(1), especially for areas where there are high-level localized levels of pollutants or for new sources which will have a significant impact on air quality. Health & Saf. Code Sec. 40440(b)(3). An indirect source is "a facility, building, structure, installation, real property, road, or highway which attracts, or may attract, mobile sources of pollution." CAA Sec. 110(a)(5)(C); 42 U.S.C. Sec. 7410(a)(5)(C). A railyard meets this definition and thus may be the subject of an indirect source rule.

In the past, the railroads have argued that only CARB has the authority to regulate locomotives as a matter of state law. Since what is proposed is an indirect source rule, and not a regulation of locomotives, this issue is irrelevant. In any event, we disagree. State law provides that the air districts are primarily responsible for "control of air pollution from all sources, other than emissions from motor vehicles." Health & Saf. Code Sec. 40001. This includes locomotives. CARB legal counsel agrees with our interpretation. In earlier litigation over the SCAQMD's rail idling rules, the trial court held that the SCAQMD could not regulate locomotives, but since the

---

<sup>1</sup> Staff has already stated its view briefly at the February 16, 2018 Mobile Source Committee discussion of this issue, which is part of the record for Agenda Item 32. In addition, staff's view has been expressed in responses to comments on the 2016 AQMP, in legal proceedings before the Surface Transportation Board, Docket 35803, (a proceeding in which the Association of American Railroads, BNSF, and Union Pacific participated), and in letters to US EPA. Accordingly this memo is being made available to the public.

Ninth Circuit did not affirm that holding, it is not binding. *Martin v. Henley*, 452 F. 2d 295,300 (9<sup>th</sup> Cir. 1971). The Ninth Circuit said: “[W]e assume without deciding that the rules fall within the District’s regulatory authority.” *Association of American Railroads v. South Coast Air Quality Management District*, 622 F. 3d 1094, 1096 n. 2 (9<sup>th</sup> Cir. 2010)(“AAR”)

In commenting on the 2016 AQMP, the Association of American Railroads asserted that the proposed facility-based measure would violate the trial court’s injunction against enforcing the previously-adopted idling regulation. The trial court held that the idling rules were preempted by the Interstate Commerce Commission Termination Act (“ICCTA”). However, the proposed indirect source rule would be a new rule, not enforcement of an existing rule. Further, it would not specify that the railyards must limit idling. Therefore, adopting the proposed new rule would not violate the injunction.

### ***Issue 2: Preemption***

While the Clean Air Act (CAA) generally preempts state and local governments from establishing emission standards for motor vehicles and non-road engines, including locomotives, the CAA does not preempt indirect source rules. *National Association of Home Builders v. San Joaquin Valley Unified Air Pollution Control District*, 627 F. 3d 730 (9<sup>th</sup> Cir. 2010).

The Ninth Circuit Court of Appeals upheld the trial court’s decision that the SCAQMD locomotive idling rules were preempted by ICCTA. *AAR*, 622 F. 3d. 1094. ICCTA is a federal de-regulatory statute that places certain aspects of rail operations under the jurisdiction of the federal Surface Transportation Board (“STB”), and preempts some kinds of state and local regulation applicable to railroads. However, the Court of Appeals explained that if the rules had been approved by EPA into the State Implementation Plan, “ICCTA generally does not preempt those regulations because it is possible to harmonize ICCTA with those federally-recognized regulations...” *AAR*, 622 F. 3d 1094, 1098. The STB itself has stated that ICCTA is not intended to “interfere with the role of state and local agencies in implementing Federal environmental statutes such as the Clean Air Act, the Clean Water Act, and the Safe Drinking Water Act, unless the regulation is being applied in such a manner as to unduly restrict the railroad from conducting its operations on unreasonably burden interstate commerce.” *Friends of the Aquifer*, 2001 WL 928949, STB F.D. No. 33966 at 5 (Aug. 15, 2001) Staff recommends that any railyard indirect source rule specify that it is not to become operative until approved into the SIP, to ensure that the rule can be harmonized with ICCTA in any judicial challenge.

The courts have provided guidance in how to “harmonize” two overlapping federal statutes, stating that the overriding purposes or objectives of each statute must be determined, and that if a challenged provision implements a core purpose of one law while affecting only the periphery of the other, the first provision must be upheld. *Morton v. Mancari*, 417 U.S. 535,550 (1974); *Merrill Lynch Pierce Fenner & Smith v. Ware*, 414 U.S.117, 131-136. (1973). The STB itself has also provided guidance, holding that in determining whether a federal environmental statute (or state rule implementing such a statute) unreasonably interferes with rail operations, “[t]he severity of the likely environmental impacts should be weighed against the severity of the transportation impacts of compliance to determine whether, and how, the various Federal statutes

can be accommodated.” *Joint Petition for Declaratory Order-Boston & Maine Corp. and Town of Ayer*, 2001 WL 1174385, STB Finance Docket 33971 (Oct. 3, 2001). Staff believes an indirect source rule can be crafted that would provide significant environmental benefits outweighing any adverse impacts on rail transportation, and could thus be harmonized with ICCTA. In particular, the indirect source rule is not expected to specify a method of compliance, so that the railyard can select its own methods for compliance to minimize any adverse impact.

We also wish to advise you that in 2014, the U.S. EPA filed a petition for declaratory order with the STB asking for a ruling on whether the SCAQMD idling rules would be preempted if they were approved in to the SIP. The STB declined to issue such an order, but instead issued “guidance” stating that the rules would “likely” be preempted even if approved into the SIP. *United States Environmental Protection Agency-Petition for Declaratory Order*, STB Docket FD 35803 (served Dec. 30, 2014). The STB based its opinion on the potential for other states or localities to adopt and implement conflicting rules. While we disagreed with the STB “guidance,” the manner in which it was issued made it unable to be reviewed in court under the federal Administrative Procedures Act. STB stipulated with us that the “guidance” could be reviewed if EPA or any other agency were to rely on it, e.g. in disapproving the existing idling rules. EPA has not taken action on these rules as of yet. The STB “guidance” could also be challenged if EPA were to rely on it in disapproving a future indirect source rule. In any event, staff believes that an indirect source rule that provides flexibility to the railyards for compliance would not present a serious risk of inconsistent requirements in other jurisdictions and thus would not be preempted under the theory used by the STB in its “guidance.”

### ***Conclusion***

An indirect source rule for railyards is within the SCAQMD’s state law authority, and likely could be crafted in a way that would allow it to survive the harmonization process and therefore not be preempted.

cc: Wayne Nastri

***Staff Responses to Comment Letter #4:******Response to Comment 4-1***

Staff appreciates the support and recognition of the need for PR 2306 as an integral piece of a broader plan needed for the South Coast AQMD to address emissions from the goods movement sector for the purpose of attaining health-protective NAAQS, avoiding potential federal sanctions triggered by nonattainment, and addressing air quality priorities for the region's AB 617 communities.

***Response to Comment 4-2***

Please refer to staff response to Comment 1-3.

***Response to Comment 4-3***

Staff acknowledges the need for locomotives to transition to cleaner technologies. PR 2306 is designed to work in conjunction with CARB's In-Use Locomotive and ACF regulations to ensure emission reductions for freight rail yards in the South Coast AQMD region will occur at levels that are at least proportional, if not more than proportional, to statewide emission reductions achieved from implementation of state regulations.

***Response to Comment 4-4***

Please refer to staff responses to Public Workshop Comment PW-10-c and Comment 1-3. Moreover, South Coast AQMD's regulatory authority is limited to air pollution control and is unable to promulgate rules addressing other forms of pollution and environmental nuisances.

***Response to Comment 4-5***

Please refer to staff response to Comment 1-4.

***Response to Comment 4-6***

Staff appreciates the comment and consider it as largely consistent with PR 2306 requirements related to zero emission infrastructure.

***Response to Comment 4-7***

Please refer to staff response to Comment 1-5.

With regard to information access, please refer to staff responses to Public Workshop Comment PW-3-b and Comment 1-7. With regards to potential monetary penalties, please refer to staff responses to Public Workshop Comment PW-8-a and Comment 1-8.

***Response to Comment 4-10***

Staff appreciates the concluding comment and concur with the importance of public health protection in South Coast AQMD rulemaking and implementation of AQMP control measures.

Comment Letter #5 from the Pacific Merchant Shipping Association

June 18, 2024

Ian MacMillan
Assistant Deputy Executive Officer
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, California 91765

Submitted to: railyardisr@aqmd.gov

Subject: Comments on Proposed Rule 2306 – Railyard Indirect Source Rule

Dear Mr. MacMillan:

As you know, the Pacific Merchant Shipping Association (PMSA) has been actively engaged with South Coast Air Quality Management District (SCAQMD) staff and Board Members on development of the proposed Port Indirect Source Rule (ISR). The development of Proposed Rule 2306 (PR2306) has now raised additional concerns that are addressed below. As always, PMSA believes that in order to be successful, any regulatory scheme must effectively target the source of emissions and do so in a way that does not interfere with operations and is not duplicative of existing regulatory programs. PMSA is deeply concerned that PR2306 is duplicative, incompatible with the proposed port indirect source rule, and will not reduce emissions while substantially burdening facilities with additional reporting requirements.

Comment 5-1

No Demonstrated Need

SCAQMD staff has not demonstrated the need for the PR2306. Staff presentations make clear that there are no likely emission reductions beyond the recently adopted California Air Resources Board In-Use Locomotive Regulation. The only justification for the rule provided by staff is that there is some unquantified possibility that emissions reductions under the State rule could disproportionately happen in parts of the State outside of the South Coast Air Basin. With the concentration of rail activity in the South Coast, it strains credulity to imagine a scenario where emissions reductions could occur disproportionately outside South Coast. As the sole basis demonstrating the need for PR2306, SCAQMD staff should quantify what likely and reasonable scenarios exist that would result in disproportionate emissions reductions outside the South Coast. Without such an analysis, the benefit of PR2306 is speculative at best.

Comment 5-2

PR2306 Exemptions

Based on staff presentations, it appears that the intent of PR2306 is to contain a “full exemption” for facilities in the port complex. The language contained in the draft rule language does not accomplish this. The draft language would exempt port facilities that are not intermodal rail facilities. By design, marine terminals are intermodal facilities; their purpose is to transfer cargo between ships and trucks and trains. As written, the proposed exemption language does not accomplish SCAQMD staff’s stated

Comment 5-3

Comments on Proposed Rule 2306 – Railyard Indirect Source Rule  
June 18, 2024  
Page 2

goals; the language is vague and unclear. SCAQMD should consider explicit language regarding which facilities are regulated and which facilities are exempt from the proposed rule.

Equally concerning is the concept of a “full exemption” presented during the public workshop on June 4, 2024. In fact, there is no “full exemption” due to the design of PR2306. While it appears that between PR2306 and the proposed port ISR there is no overlap in identified regulated entities, SCAQMD staff made clear during the workshop that nothing in PR2306 excludes the same activity being regulated simultaneously under both proposed rules. This is deeply problematic. PR2306 makes the operator of locomotives directly responsible for emissions reductions from their operations on a facility-by-facility basis. Since multiple regulated facilities under PR2306 share responsibility for the same activity, it is in the interest of facilities regulated under PR2306 to maximize their actions on activity that involves multiple facilities, thereby minimizing their cost and maximizing the benefit of any action taken. This rule design would have two detrimental impacts on marine terminal operators under a proposed port ISR. First, facilities regulated under PR2306 would be incentivized to maximize emissions reductions outside the port complex since maximum benefit would be achieved by focusing emissions reductions on activity between multiple regulated facilities, all of which would be outside of the port complex. Second, marine terminal operators would still be responsible for emissions reductions from locomotive activity under the concept proposed by SCAQMD staff, but no opportunity would exist for emission reductions beyond what PR2306 regulated facilities would already be implementing.

Comment  
5-3 Con't

PR2306 needs to include an actual full exemption for both the regulated facility and the regulated activity. It should be clear that any activity subject to PR2306 will not also be subject to the proposed port ISR. Failing to do so would create a situation where marine terminal operators would be subject to limits on activity that the facility would have no ability to influence.

**Additional CEQA Review Required**

SCAQMD proposes that no additional review under the California Environmental Quality Act (CEQA) is required beyond the reviews that were conducted in Program environmental Impact Report (EIR) for the 2016 and 2022 Air Quality Management Plans (AQMPs). One of the primary purposes of preparing a PEIR is that impacts of specific actions of a larger program are speculative at the time of the program adoption. A project-specific EIR would allow for the analysis of environmental impacts not previously possible. This is demonstrated by the text of the 2016 Program EIR. In one of many examples, the Program EIR states:

The 2016 AQMP would establish in-use strategies that may require or promote the use of alternative fuels including control measures MOB-01, MOB-02, MOB-03, MOB-04, MOB-05, OB-07, MOB-09, MOB-10, MOB-13, EGM-01, ORLD-01, ORLD-3, ORHD-02, ORHD-04, ORHD-05, ORHD-06, ORHD-07, ORHD-08, ORH-09, ORFIS-01, ORFIS-05, OFFS-01, OFFS-04, OFFS-05, OFFS-07, and OFFS-08.

Comment  
5-4

Here, the PR2306 (MOB-02) is lumped into a series of AQMP control measures that “*may require or promote the use of alternative fuels*”. That speculation is repeated throughout the Program EIR for the

Comments on Proposed Rule 2306 – Railyard Indirect Source Rule

June 18, 2024

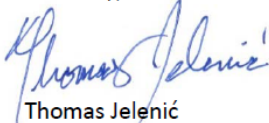

Page 3

various resource areas. While that speculative approach may be acceptable in a Program EIR, additional analysis is required for the adoption of PR2306. Presumably, SCAQMD staff believes regulated facilities will take action on a facility-level basis to meet the requirements of PR2306 – as that is the intended goal. By not quantifying the need for the regulation (as discussed previously) and therefore, what actions would be necessary to comply with PR2306, SCAQMD staff is avoiding analysis of actions that staff must believe are necessary to avoid disproportionate emissions reductions taking place outside the South Coast. SCAQMD staff must do a proper CEQA analysis on PR2306.

Comment  
5-4 Con't

PMSA appreciates the opportunity to submit these comments.

Sincerely,

Thomas Jelenić  
Vice President

### *Staff Responses to Comment Letter #5:*

#### ***Response to Comment 5-1***

Staff appreciates the commentor's participation in multiple rulemakings and providing comments throughout the rule development process. Staff has demonstrated in this report the necessity, consistency, and non-duplication of the proposed rules pursuant to Health and Safety Code Section 40727. A similar demonstration will be performed for any potential future rule, including any rule to address emissions associated with marine ports. For emission reduction estimates, please refer to Table 3-5 and the associated discussion in this report, as well as staff response to Comment 5-2 below.

#### ***Response to Comment 5-2***

PR 2306 is part of the AQMP Facility Based Mobile Source Measures aimed to reduce freight emissions from the goods movement sector that are a major contributor to the region's attainment challenges. Please refer to Chapter 2, *Public Health and Air Quality Needs* section, of this report for the significant health impacts and air quality needs in South Coast AQMD, and Box 4-2 in Chapter 4 for the potential consequences of nonattainment. Moreover, staff acknowledges that reducing freight rail yard emissions within our region cannot be accomplished by one rule alone. PR 2306 is positioned to be one component of the multi-agency regulatory framework to collectively address goods movement emissions within our region (including from rail yards), along with state and federal regulations promulgated by CARB and U.S. EPA using their respective authorities.

Regarding emission reductions potential, please refer to staff responses to Public Workshop Comment PW-10-c and Comment 1-3. Furthermore, staff respectfully disagrees with the assessment in the comment that "it strains credulity to imagine a scenario where emissions reductions could occur disproportionately outside South Coast." Take the same example of locomotive emissions referenced in the comment. Based on the annually reported data under the 1998 MOU between CARB and the two Class 1 railroads, a total of 4,554 locomotives operated by Union Pacific Railroad visited or operated within the South Coast Air Basin at any time during 2022, and the corresponding number was 5,344 for BNSF Railway. Among the approximately 10,000 locomotives, the majority of them are line haul locomotives, as well as locomotives conducting regional switching activities, that are not captive to a single freight rail yard or to the South Coast AQMD region. Based on CARB's estimate, only about 17 percent of line haul locomotive activities, thereby emissions, occur in the South Coast AQMD region.<sup>153</sup> Moreover, Class 1 line haul locomotives do not only travel in and out of the South Coast AQMD region, but they belong to the two railroads' respective nationwide fleets that can be deployed anywhere in the nation. The non-captive nature of the locomotive fleet is a key factor why our region has seen in recent years significantly more work (in megawatt-hours) done by the dirtiest locomotives (Tier 1/1+ or dirtier) when compared to a decade ago.<sup>154</sup> This is despite increasingly more stringent federal locomotive standards with the cleanest current standard being Tier 4. Based on

---

<sup>153</sup> See the 2021 Line-Haul Locomotive Emission Inventory [https://ww2.arb.ca.gov/sites/default/files/2021-02/2021\\_line\\_haul\\_locomotive\\_emission\\_inventory\\_final.pdf](https://ww2.arb.ca.gov/sites/default/files/2021-02/2021_line_haul_locomotive_emission_inventory_final.pdf)

<sup>154</sup> See the 2022 Compliance Report and Data Summaries published by CARB for the 1998 MOU at: <https://ww2.arb.ca.gov/resources/documents/rail-emission-reduction-agreements>.

observations as such as well as the design of statewide regulations, it is therefore not beyond the realms of possibility that South Coast AQMD may not benefit from proportional implementation of statewide regulations. Moreover, uneven implementation of existing statewide rules and programs has been seen with CARB's Advanced Clean Cars (ACC) regulation.<sup>155</sup> An even more pertinent example is how the phase-in implementation of CARB's statewide Truck and Bus regulation has impacted turnover of drayage trucks differentially across California air districts, with a turnover to cleaner trucks that occurred more slowly in South Coast AQMD. Please refer to Chapter 2 of this report for more details.

Based on the above, PR 2306 emission reductions targets are set at levels to ensure that proportional or more-than-proportional emission reductions will be achieved at facility-level in the South Coast AQMD region relative to emission reductions achieved throughout California from implementation of state regulations. For more details on the public health and air quality needs, please refer to Chapter 2 of this report.

### ***Response to Comment 5-3***

Staff appreciates the concern raised by this commenter and similar comments regarding exemption language from the ports of Los Angeles and Long Beach. However, the comments here regarding how railroads would respond if both PR 2306 and PR 2304 (marine ports) were promulgated is speculative, as no draft rule language has been released for PR 2304, and the rule concept is still in development.

In the PR 2306 preliminary draft rule language released on May 17, 2024, the exemption language in paragraph (j)(2) clearly exempts freight rail yards that are used primarily for on-port switching activities and owned/operated by either cities (or their respective port authorities) and any third party contracted under operating agreement(s) with either city. Additionally, based on their current operating model, the definition of "Freight Rail Yard" in the rule will exclude on-dock rail facilities located on marine terminals as these facilities are operated by terminal operators who do not operate locomotives outside of their terminals, if at all. Still, after considering this comment from PMSA and similar comments submitted by the Port of Long Beach and the Port of Los Angeles (see Comment Letters #6 and #7, respectively), staff has revised the exemption language in paragraph (j)(2) to explicitly clarify the exemption for on-dock rail facilities located on marine terminals at the San Pedro Bay Ports. The revisions remain consistent with the original intent and will only exempt on-dock intermodal rail facilities and any non-intermodal freight rail yards whose operations are solely for the purpose of moving railcars to and/or from marine terminals at the ports of Long Beach or Los Angeles.

The phrase "full exemption" used in the staff presentation at the PR 2306 and PR 316.2 Public Workshop, held on June 4, 2024, was meant to contrast the full exemption in PR 2306 paragraph (j)(2) with the partial exemption provided in paragraph (j)(1), the latter of which will exempt low-

---

<sup>155</sup> Please see South Coast AQMD staff's analysis included in PR 2305 Staff Report (May 2021): Chapter 1 - <http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2021/2021-May7-027.pdf> for analysis of Advanced Clean Cars. Additional information about CARB's 1998 Railroad MOU and the Truck and Bus Rule can be found in Box 2-1 and Box 2-2 of the Draft Staff Report.

activity sites from some but not all rule provisions.<sup>156</sup> The phrase “full exemption” was never meant to imply that PR 2306 intends to exempt all rail activities related to port operations, as seemingly suggested by the comment.

In fact, as mentioned in staff response to Public Workshop Comment PW-17, PR 2306 requires a freight rail yard operator to demonstrate compliance with the proposed rule requirements by including any activities that are associated with that specific freight rail yard, whether or not the activities are also associated with the operation of other indirect sources of emissions such as another freight rail yard or a marine terminal. A freight rail yard operator needs not be concerned by the eventual accounting of SIP creditable emission reductions for the South Coast AQMD region. As emphasized in this report, including this appendix, PR 2306 is part of the suite of AQMP Facility Based Mobile Source Measures (FBMSM) aimed at collectively addressing freight emissions in the South Coast AQMD region. Each of these measures is designed to promote actions to be taken by separate, non-overlapping groups of freight hubs (including freight rail yards) that will result in or facilitate reductions of emissions associated with their operations. And each such measure is implemented in a manner such that the same freight hub, as an indirect source of emissions, would not be subject to multiple facility-based rules. The interconnectivity of the goods movement sector, along with South Coast AQMD authority considerations, necessitate a control strategy like FBMSM which focuses on freight hubs and emissions-reducing and -facilitating actions taken individually, or potentially jointly, by these freight hubs. When a freight rail yard operator takes action to reduce its facility emissions from locomotives and/or any other freight rail yard sources that travel between the freight rail yard and the ports, port emissions will be also reduced as a result. Staff appreciates PMSA’s continued engagement in FBMSM implementation and participation in PR 2304 rulemaking to address freight emissions associated with marine port operations.

#### ***Response to Comment 5-4***

Relative to the suggestion that a project-specific CEQA document needs to be prepared for PR 2306, please see staff response to Comment 3-2 which describes the CEQA requirements applicable to PR 2306 and the basis for how the environmental analysis was conducted. Please also see Appendix A: Detailed CEQA Analysis which summarizes the prior environmental analyses conducted in the Final Program EIRs for the 2022 AQMP and 2016 AQMP and demonstrates that PR 2306 constitutes a later activity of these previously approved programs (i.e., 2022 AQMP and 2016 AQMP) under CEQA Guidelines Section 15168(c)(3).

## Comment Letter #6 from the Port of Long Beach

June 18, 2024

Ian MacMillan, Assistant Deputy Executive Officer  
South Coast Air Quality Management District  
21685 Copley Drive  
Diamond Bar, CA 91765  
Email: [imacmillan@aqmd.gov](mailto:imacmillan@aqmd.gov)

Subject: Port of Long Beach Comments on the Proposed Rule 2306 – Freight Rail Yards

Dear Mr. MacMillan:

On June 4, 2024, the South Coast Air Quality Management District (South Coast AQMD) remotely held Proposed Rule 2306 (PR 2306) – Freight Rail Yards Workshop, which provided an update on the draft Indirect Source Rule for Rail Yards. Slide 42 of the workshop presentation, dated May 31, 2024, indicates that the South Coast AQMD intends to exempt on-port switching locomotive activity from PR 2306. The slide notes that this exemption is made in Paragraph (j)(2) and in Paragraph (c)(9) within the definition of a Freight Rail Yard in the May 17, 2024 Preliminary Draft Proposed Rule 2306.

The Port of Long Beach (Port) appreciates that this exemption is intended to clarify the intended locomotive activity regulated by Proposed Rule 2306 – Rail Yards and Proposed Rule 2304 – Commercial Marine Ports. It is our understanding, pursuant to verbal discussions with South Coast AQMD staff, that the South Coast AQMD intends to regulate Port-related locomotive activity under Proposed Rule 2304 and not under Proposed Rule 2306. This important distinction must be adequately reflected in the rule language. Without clear, unambiguous language, regulated entities may be responsible for mitigating the same rail activity under both Proposed Rule 2304 and Proposed Rule 2306.

However, the exemption language as presently written does not exempt all rail activity occurring on property owned by the Ports of Long Beach and Los Angeles, and therefore, would result in rail activity that would be regulated by both PR 2304 and PR 2306. For example, Paragraph (j)(2) does not exempt Freight Rail Yards that are considered Intermodal Rail Yards under the rule. Therefore, on-dock rail activity which takes place on marine terminals is not exempted from this rule, and the marine terminal would be considered a Freight Rail Yard subject to PR 2306. If this language remains in PR 2306, the on-dock rail activity would be controlled by two South Coast AQMD rules, in addition to the California Air Resources Board's In-Use Locomotive Regulation.

To minimize an already complex regulatory landscape, the Port would like to propose modified rule language for Proposed Rule 2306. In Paragraph (j)(2), the Port proposes the following revised language:

Comment  
6-1

“The City of Long Beach, the City of Los Angeles, and/or any third party under contractual operating agreement(s) with the City of Long Beach and/or the City of Los Angeles are not subject to the requirements of this rule for any of its owned or operated-Freight Rail Yards where the primary Freight Rail Yard Operations are to move cargo onto Railcars to and from docks at marine terminal(s), or move Railcars between marine terminals located within the Long Beach Harbor District or the Los Angeles Harbor District (Harbor Districts).”

We believe that by limiting the exemption to the Long Beach and Los Angeles Harbor Districts, this new language achieves the South Coast AQMD’s original goal to exempt locomotive activity at marine terminals. This language would not exempt the Dolores, Watson, or Mead Rail Yards because they are not located within the Long Beach or Los Angeles Harbor Districts. ICTF would be excluded from the proposed revision, because ICTF’s “primary Freight Rail Yard Operations” are not to move cargo onto railcars to and from the docks at marine terminals located in the Harbor Districts, or to move railcars between marine terminals located within the Harbor Districts. ICTF’s primary operations are to move containers trucked from terminals located within the Harbor Districts to ICTF for loading/unloading onto/from trains that depart to/arrive from the Alameda Corridor. Please find a reference map to the Long Beach Harbor District, as requested by the South Coast AQMD staff, attached.

Comment  
6-1 Con't

Additionally, not all loading, unloading, transport, or movement of containerized or non-containerized freight at the Ports include empty containers and chassis, so the Port requests that the South Coast AQMD replace “including empty containers and chassis” with “which may include empty containers and chassis” in all locations where this language presently exists, including the “Classification Yard” and “Freight Rail Yard Operations” definitions.

Comment  
6-2

The Port also requests removal of Section (i) in the rule. All local, state, and federal laws established by regulatory agencies already require compliance from regulated parties. There is no legal mandate to require local or state government agencies that contract with a party for rail services to state in the contract that the party must comply with Rule 2306. Section (i) introduces an unnecessary administrative burden to the Ports of Long Beach and Los Angeles.

Comment  
6-3

Thank you for your consideration of these comments. If you have any questions about this letter, please contact Morgan Caswell, Manager of Air Quality Practices, at Morgan.Caswell@polb.com.

Sincerely,

James Vernon  
Acting Director of Environmental Planning

6/18/2024

Page 2 of 2

### *Staff Responses to Comment Letter #6:*

#### ***Response to Comment 6-1***

Staff appreciates Port of Long Beach’s suggestion for modifying PR 2306 rule language in paragraph (j)(2) and providing the reference map. Please refer to staff response to Comment 5-3 for more detailed discussion. As indicated in that response, PR 2306 intends to exempt from the proposed rule the owners and operators of marine terminals, specifically those with on-dock rail capabilities. This is because these entities are potentially subject to PR 2304, which is the facility-based rule proposed to address port emissions. Staff appreciates the suggestion for improving rule clarity and have revised PR 2306 paragraph (j)(2) to explicitly exempt such marine terminal owners and operators. Additionally, staff would like to reiterate the nature of any facility-based rule, PR 2306 included, as applying to indirect sources of emissions (as facilities) instead of any specific mobile sources attracted to those facilities.

#### ***Response to Comment 6-2***

Staff appreciates the comment and have revised the rule language as suggested for the purpose of added clarity.

#### ***Response to Comment 6-3***

PR 2306 subdivision (i) provides an added layer of enforceability for PR 2306 compliance, and it also serves to ensure that any actions carried out under such contracts do not potentially negate the effect of the proposed rule. Moreover, based on staff’s review of multiple operating and other contractual agreements between the Port of Long Beach (or the Port of Los Angeles) and its counterparties, it is already a common practice that the Ports include in such contractual agreements certain provisions to require compliance by a counterparty (or counterparties) with all applicable and lawfully enacted federal, state, and local laws, regulations, rules, and other requirements. The Alameda Corridor Use and Operating Agreement is one such example, and it is an agreement among both cities/ports, the Alameda Corridor Transportation Authority (which is a joint powers authority formed by both cities), and the two Class 1 railroads including the Union Pacific Railroad and the BNSF Railway.<sup>157</sup> In this agreement, there are several provision related to compliance with “all applicable law” (or phrases of similar effect), for example for maintenance of equipment (p. 20), operations on the Alameda Corridor and on tracks owned by either Ports (p. 21), maintenance and repair of tracks (p. 45), storage and holding (p. 48). Further, this agreement includes an entire section on “marketable emission reduction credits” administered by South Coast AQMD (pg. 66), however this appears to be speculative as staff is not aware of any applicable credits that have ever been granted to the parties to this agreement. Regardless, staff believes that specific provisions within state or local government agency contractual agreements regarding PR 2306 is appropriate and necessary given the importance of reducing emissions from these facilities, the role of state and local government agencies when entering into contracts to serve the public, and current practice in these agreements. Still, after considering this comment from the Port of Long Beach and a similar comment submitted by the Port of Los Angeles (see Comment Letter

---

<sup>157</sup> See: <https://www.acta.org/wp-content/uploads/2021/01/Executed-Alameda-Corridor-UOA.pdf>.

#7), staff has revised the language in paragraph (i) to clarify that inclusion of provision(s) in such contractual agreements that have the effect of requiring compliance with Rule 2306 (if adopted and becomes effective) by the contracted freight rail yard owner or operator would suffice to satisfy this rule requirement for the state or local public agencies.

## Comment Letter #7 from the Port of Los Angeles

Subject: PORT OF LOS ANGELES COMMENTS ON THE PROPOSED RULE 2306 -  
FREIGHT RAIL YARDS

Dear Mr. MacMillan:

On June 4, 2024, the South Coast Air Quality Management District (South Coast AQMD) remotely held Proposed Rule 2306 (PR 2306) – Freight Rail Yards Workshop, which provided an update on the draft Indirect Source Rule for Rail Yards. Slide 42 of the [workshop presentation](#), dated May 31, 2024, indicates that the South Coast AQMD intends to exempt on-port switching locomotive activity from PR 2306. The slide notes that this exemption is made in Paragraph (j)(2) and in Paragraph (c)(9) within the definition of a Freight Rail Yard in the May 17, 2024, Preliminary Draft Proposed Rule 2306.

The Port of Los Angeles (POLA) appreciates that this exemption is intended to clarify the intended locomotive activity regulated by Proposed Rule 2306 – Rail Yards and Proposed Rule 2304 – Commercial Marine Ports. It is our understanding that the South Coast AQMD intends to regulate Port-related locomotive activity under Proposed Rule 2304 and not under Proposed Rule 2306. This important distinction must be adequately reflected in the rule language. Without clear, unambiguous language, regulated entities may be responsible for mitigating the same rail activity under both Proposed Rule 2304 and Proposed Rule 2306.

However, the exemption language as presently written does not clearly reflect the intent of South Coast AQMD to exempt all rail activity occurring on property owned by the Ports of Long Beach and Los Angeles, and therefore, would result in rail activity that would be regulated by both PR 2304 and PR 2306. For example, Paragraph (j)(2) does not exempt Freight Rail Yards that are considered Intermodal Rail Yards under the rule. Therefore, intermodal on-dock rail activity that takes place on marine terminals is not exempted from this rule, and the marine terminal would be considered a Freight Rail Yard subject to PR 2306. If this language remains in PR 2306, the on-dock rail activity would be controlled by two South Coast AQMD rules, in addition to the California Air Resources Board In-Use Locomotive Regulation.

To minimize an already complex regulatory landscape and reflect South Coast AQMD's intent, the POLA would like to propose modified rule language for Proposed Rule 2306. In Paragraph (j)(2), the POLA proposes the following revised language:

Comment  
7-1

“The City of Long Beach, the City of Los Angeles, and/or any third party under contractual operating agreement(s) with the City of Long Beach and/or the City of Los Angeles are not subject to the requirements of this rule for any of its owned or operated-Freight Rail Yards where the primary Freight Rail Yard Operations are to move cargo onto Railcars to and from docks at marine terminal(s), or move Railcars between marine terminals located within the Long Beach Harbor District or the Los Angeles Harbor District (Harbor Districts).”

We believe that by limiting the exemption to the Long Beach and Los Angeles Harbor Districts, this new language achieves the South Coast AQMD’s original goal to exempt locomotive activity at marine terminals. Our proposed language would not extend the exemption to the Dolores, Watson, or Mead Rail Yards because they are not located within the LA or LB Harbor Districts. ICTF would also still be regulated by PR 2306 because ICTF’s “primary Freight Rail Yard Operations” are not to move cargo onto railcars to and from the docks at marine terminals located in the Harbor Districts or move railcars between marine terminals located within the Harbor Districts. ICTF’s primary operations are to move containers trucked from terminals located within the Harbor Districts to ICTF for loading/unloading onto/from trains that depart to/arrive from the Alameda Corridor. Please find the reference maps to the Los Angeles Harbor Districts, as requested by the South Coast AQMD staff, attached.

Comment  
7-1 Con't

Additionally, not all loading, unloading, transport, or movement of containerized or non-containerized freight at the Ports include empty containers and chassis, so the Ports request that the South Coast AQMD replace “including empty containers and chassis” with “which may include empty containers and chassis” in all locations where this language presently exists, including the “Classification Yard” and “Freight Rail Yard Operations” definitions.

Comment  
7-2

POLA also requests modification of Section (i) in the rule to read as follows.

“(i) Any state or local government agency who enters, renews, or amends a Contractual Agreement, which is separately enforceable independent of this rule and the California Environmental Quality Act, shall include in such Contractual Agreement(s) that the applicable countersigned party or parties must comply with all applicable federal, state and local laws, rules and regulations that govern the countersigned party’s activities.”

Comment  
7-3

This modification will reduce the unnecessary administrative burden on POLA. All local, state, and federal laws established by regulatory agencies already require compliance from regulated parties and POLA’s contracts already include standard language requiring counterparties to comply with all applicable laws, rules, and regulations that govern their operations.

Thank you for your consideration of these comments. If you have any questions about this letter, please contact Lisa Wunder, Acting Director of Environmental Management, at LWunder@portla.org.

Sincerely,

AVIN P SHARMA  
Senior Director, Labor Relations and Government Affairs

APS:vb

***Staff Responses to Comment Letter #7******Response to Comment 7-1***

Staff appreciates Port of Los Angeles's suggestion for modifying PR 2306 rule language in paragraph (j)(2) and providing the reference map. Please refer to staff responses to Comments 5-3 and 6-1.

***Response to Comment 7-2***

Please refer to staff response to Comment 6-2.

***Response to Comment 7-3***

Please refer to staff response to Comment 6-3. Staff believes that the revised rule language is consistent with the suggested language provided by the commentor, which reflects the Port of Los Angeles's current practice for its contractual agreements.

**Comment Letter #8 from Sierra Club**

**From:** Yassi Kavezade [REDACTED]  
**Sent:** Tuesday, June 25, 2024 10:30 AM  
**To:** Elaine-Joy Hills [REDACTED]; Ian MacMillan [REDACTED]  
**Subject:** [EXTERNAL] Quick question on labor

Hi all,

Speaking very roughly here.. As tech for ZE cargo handling increases and brings on the possible threat of automation and displacement for workers, I am wondering how we can partner with unions operating at Railyards and ports to embed worker training language or some kind of job retention protection language to encourage operators to select technology that is safe for workers, fund trainings, and minimizes jobs displacement, etc. I'm sure there ideas out there from union leaders themselves.

Could this be something required in reporting data they turn into you? I know it's outside jurisdiction already but would there be any creative place to see these rules as way to grow jobs.

Thanks for entertaining this random question. Also really excited to get these rules done and continue this legacy at the air district.

**Staff Responses to Comment Letter #8**

**Response to Comment 8-1**

Staff appreciates the comment from Sierra Club. Staff has continued engagement with various stakeholders including labor groups. As correctly indicated in the comment, South Coast AQMD's regulatory authority is limited to air pollution control; as such, PR 2306 requirements are proposed for the purpose of reducing and facilitating emission reductions. In complying with PR 2306 requirements, staff expects that freight rail yard operators will also independently comply with any pertinent labor or safety rules and regulations; however, it is not within South Coast AQMD's purview to enforce such rules and regulations.

At the same time, Health and Safety Code Section 40728.5 requires that the South Coast AQMD Governing Board make good faith effort to minimize adverse socioeconomic impacts, including potential impacts on regional employment. The Socioeconomic Impact Assessment as included in Chapter 4 of this report does not identify additional employment impacts beyond what have been analyzed in CARB's regulatory impact analysis for statewide regulations. However, staff continues to welcome further feedback and suggestions during PR 2306 rulemaking (and

separately for PR 2304 rulemaking). While this rulemaking does not necessarily provide a mechanism to address job impacts as described in the comment, staff appreciates the issue raised and will continue to seek ways to address job impacts through other means. As one example, as part of the Volvo LIGHTS project for zero emission trucks, South Coast AQMD co-funded training programs for workers at Rio Hondo College and San Bernardino Valley College (<https://www.lightsproject.com/project-partners/>, <https://www.aqmd.gov/home/research/pubs-docs-reports/newsletters/august-september-2022/volvo-lights-project-wins-award>).

Additionally, please also refer to staff response to Comment PW-2 in terms of technology neutrality of PR 2306.
